

# Steps to calculate inflation using producer price index

This slide shows step by step process which can be used to calculate inflation rate by using producer price index. It includes stages such as select year, determine goods, gather price data, calculate price index, etc.

## Select Year

- Choose a base year as the starting point
- Choose current year for which inflation is to be calculated

## Gather Price Data

- Collect prices data of items in basket for both base year and current year
- Use sources such as surveys, government agencies, or marketplaces

## Calculate Weighted CPI

- Assign weights to each item based on their relative importance in production or industry
- Multiply each item's price index by its weight
- Sum up the weighted price indexes for all items to get the weighted CPI

## Result

- Positive inflation rate indicates price increases at the producer level
- Negative rate indicates decrease in price (Deflation)
- Add text here

## Determine Goods

- Identify specific set of goods and services
- These items should reflect the items produced and sold by producers

## Calculate Price Index

- Calculate price index for each item using formula
- Formula : Price Index = (Price in Current Year / Price in Base Year) \* 100

## Calculate Inflation Rate

- Calculate percentage change in weighted CPI between base year and current year
- Inflation Rate = (Weighted CPI in Current Year - Weighted CPI in Base Year) / (Weighted CPI in Base Year) \* 100
