How to Make a Lava Lamp

What Happened?

A lava lamp works because of two different scientific principles: density and polarity.

Density is the measurement of how compact a substance is. The denser it is, the more it will sink to the bottom of a jar.

If you mix oil and water of different colors, you'll find that the water is heavier than the oil. Water is heavier than oil, so it will sink to the bottom of the jar.

Adding food coloring to the oil and water will create a mixture. The water molecules are "polar" because they have a positive electrical charge and a negative electrical charge.

Oil molecules, however, are non-polar. They don't have a positive charge, so they are not attracted to the water molecules at all. This is why oil and water don't mix. Instead of mixing, a light cream separates from the oil and water. The water molecules are the heavier, so they sink to the bottom. The oil molecules are the lighter, so they float to the top. The mixture is now a mixture of oil and water, but the water is still at the bottom.

Science

What You Do

- Step 1: Fill the flask with oil.
- Step 2: Fill the flask with water.
- Step 3: Add a few drops of food coloring.
- Step 4: Break an Alka-Seltzer tablet into four pieces and add one piece to the flask. The mixture will start to bubble and the colors will mix.
