evidence was extracted from the literature and used as development set An in silico mutagenesis approach was applied to this set to detect 4301 novel potential NLS in nuclear proteins We matched these potential NLS in protein sequences of unannotated subcellular localization to identify nuclear proteins We were able to confirm the predicted localization using our potential NLS in literature Additional to the collection of data an extensive analysis on protein sequences containing NLS and NES was performed to provide insights into subcellular localization of proteins and their occurrence in various organisms A clustering of sequences of NLS led to the separation of signals into distinct sub groups with a clear definition of a consensus sequence for each sub group Aligning potential NLS against the sub groups resulted in a refinement of the consensus sequences The results from this study reflect the scientific progress lead to further knowledge in the field of nuclear transport and highlight the usability of bioinformatics methods for the discovery of new insights in biology Nuclear transport is related to many interesting researches for example allergic reactions cancer and other diseases The outcome of this work provides a good fundament for other studies with nuclear transport signals
