1. DNA is like an _____ manual that contains all the _____ needed to make your body and to keep it running. There are roughly _____ letters in our genetic code stored in the DNA.
a. **instruction, information, 3 billion**
2. Scientists finally produce the first completed sequence of the human genome in 2003. What are 3 things can we understand now that we have the complete sequence of the human genome?
a. **It helps us understand how we are similar and different from other species, why some people respond differently to certain medications and how we can treat diseases more effectively.**
3. DNA is made of _____ which consist of _____ parts: a _____ molecule, a _____ group which is made from bonded _____ & _____ atoms, and one of _____ possible bases which all contain _____.
a. **Nucleotides, 3, sugar, phosphate, phosphorus, oxygen, 4, nitrogen**
4. DNA forms a double _____ shape which resembles a twisted ladder. The rails on either side are the _____, _____ backbones which are alternating sugar and phosphate molecules of the _____.
a. **Helix, sugar phosphate, nucleotides**
5. When looking at the DNA backbones, the left backbone starts with a _____ while the one on the right starts with a _____. Biologists call these _____ strands. The rungs of the ladder are formed by the nucleotides _____.
a. **Phosphate, sugar, antiparallel, bases**
6. The two largest bases are _____ and _____ or A & G (for short). The two smallest bases are _____ and _____ or T & C. A big base always connects with a _____ one using chemical bonds called _____.
a. **Adenine, guanine, thymine, cytosine, small, hydrogen**
7. Adenine always bonds with _____ and guanine always bonds with _____.
a. **Thymine, cytosine**
8. What do these phrases mean? "Apples grow on trees" and "Cars go in the garage".
a. **A bonds with T and C bonds with G**
9. These 4 bases are repeated over and over again in different _____ to form a message more than _____ bases long to make up your genetic code.
a. **Combinations, 3 billion**
10. What are chromosomes and where are they found?
a. **The chains of DNA molecules that are coiled up tightly around special proteins inside the nucleus of each of your cells**
11. The enzyme called _____ splits the DNA ladder in half by breaking the _____ bonds connecting the base pairs. DNA replication is done by an enzyme called _____ that attaches the correct base to the unbonded base on the original strand of DNA. This enzyme travels up the half-stands to add the missing bases, plus the _____ phosphate backbones to complete the structures to make _____ full strands of DNA.
a. **Helicase, hydrogen, DNA polymerase, sugar, 2**
12. What does it mean when we say DNA replication is semi-conservative?
a. **Each new strand of DNA is half new DNA and the other half is from the original strand.**
13. Describe what happens in the replication bubble. Use these keywords: replication fork, DNA polymerase, leading strand, complementary bases, lagging strand.
a. **DNA replication occurs in the replication bubble at each end of the replication fork. DNA polymerase on the leading strand just moves forward attaching complementary bases, but on the lagging strand the DNA polymerase is only able to add bases if it's moving forward, so it adds 5 complementary bases then jogs backward to fill in the gap with another 5 bases, adding short fragments as it moves forward, eventually all DNA fragments are connected together in one continuous string of DNA.**
14. Sometimes DNA polymerase might attach the wrong base but _____ are present to make sure DNA replication is happening correctly. These enzymes will fix the _____ but when an error isn't caught by the enzyme a _____ can occur. Some mutations can cause problems like _____ but others are _____.
a. **Enzymes, mistakes, mutation, cancer, neutral**
15. What was the scientific contribution the Okazaki added to our knowledge of DNA replication and what was their recognition?
a. **The Okazaki were able to prove that DNA replication occurs in short bursts on the lagging strand and to validate their research those short segments of DNA on the lagging strand are now known as "Okazaki fragments".**
