Changes In High School Grading Standards In Mathematics:

Changes in High School Grading Standards in Mathematics, 1982-1992 Daniel M. Koretz, Mark Berends, 2001
Observers recently have maintained that grades in secondary and postsecondary institutions have become inflated. Grade inflation would be troubling to many K-12 educators and policymakers but this possibility is a especially serious concern to many colleges and universities because such inflation could bias their admissions decisions and make it increasingly difficult for them to distinguish among high achieving students. This study examines this possibility by evaluating changes in high school grading standards across the nation as a whole from 1982 to 1992. The authors examined not only changes in the grade distribution over time but also changes in the educational system and in the characteristics of the student populations. They investigated how grades have varied between males and females, minorities and nonminorities, and poor and rich students; trends in grading standards across types of schools; relationships between grades and student performance on achievement tests; and the influence on grades of changes in tested proficiency and course taking. The authors' detailed analysis concluded that no such grade inflation has taken place at least in mathematics over the study period.

Changes in High School Grading Standards in Mathematics, 1982-1992, 2001
In recent years many observers have maintained that grades in secondary and postsecondary institutions have become inflated. Anecdotal reports of grade inflation in some instances seemingly egregious are common but few studies have attempted to evaluate systematically changes in grading standards over time. This study explores changes in high school grading standards by comparing the senior cohorts of 1982 and 1992. The data used are nationally representative surveys: the High School and Beyond study (HSB) for the 1982 cohort and the National Education Longitudinal Study of 1988 (NELS 88) for the 1992 cohort. The study explores how the distribution of grades changed over that time; how those changes varied across types of students and schools; whether the relationship between tested achievement and grades changed between 1982 and 1992; how grades changed when changes in tested proficiency and course taking were taken into account; and whether the predictors of grades changed over that decade. Descriptive analyses were carried out for overall high school grade point average (GPA) and for academic GPA in several subject areas. Multivariate analyses were restricted to mathematics because the surveys provided equatable tests only in that subject, making it impossible to control for changes in proficiency in the other subject areas. Efforts were made to use Scholastic Aptitude Test (SAT) and American College Test (ACT) scores as surrogates in other subjects but that approach was abandoned after analyses showed substantial changes in the self-selection of the tested subsamples between 1982 and 1992.
