## Section Review 11-1

1. Mendel's principle of dominance states that some alleles are dominant and others are recessive.  
 2. A trait controlled by a dominant allele will be produced if there are two dominant alleles present or one dominant allele and one recessive allele.  
 3. A trait controlled by a recessive allele will be produced only when two recessive alleles are present.  
 4. Segregation is the process during gamete formation in which the two alleles are separated from each other so that each gamete carries only a single copy of each gene. With the pea plants, each F<sub>1</sub> generation plant produces two types of gametes—for example, those with the allele for tallness and those with the allele for shortness.  
 5. True-breeding plants allowed Mendel to pinpoint the cause of variation in traits because he could control which plants bred. Without true-breeding plants, Mendel would not have been able to draw his conclusions because there would have been too many variables.  
 6. Cross-pollination is the process of one plant fertilizing another, while self-pollination occurs when a plant fertilizes itself.  
 7. 225 plants will show the trait controlled by the recessive allele.  
 8. The trait controlled by the recessive allele would not have been produced in the resulting F<sub>2</sub> generation. Both F<sub>1</sub> generation plants need to have *rr* allele combination for the trait controlled by the recessive allele to be produced in one of the F<sub>2</sub> generation plants.

## Section Review 11-2

1. Probability is the likelihood that a particular event will occur. The principles of probability can be used to predict the outcomes of genetic crosses.  
 2. Punnett squares are used to predict and compare the genetic variations that will result from a cross.  
 3. The seed color controlled by the dominant allele has a 50% probability of being produced and the seed color controlled by the recessive allele has a 50% probability of being produced. Students should have 25% and *Rr* in the upper and lower left boxes and 25% and *rr* in the upper and lower right boxes of their Punnett square.  
 4. Homozygous plants have two identical alleles for a particular trait, *TT* or *tt*. In contrast, heterozygous plants have two different alleles for a particular trait, *Tt*.  
 5. *Ff* and *FF* are different genotypes, but both combinations will produce the same phenotype, the trait controlled by the dominant *F* allele.  
 6. *TT* 25%  
 7. *Tt* 25%  
 8. *Tt* 25%  
 9. *tt* 25%

 2. multiple alleles, multiple genes  
 3. b  
 4. c  
 5. d  
 6. a  
 7. See punnett square  
 8. In incomplete dominance, the heterozygous phenotype is somewhere in between the two homozygous phenotypes. In codominance, the heterozygous phenotype shows both traits.

9. Polygenic traits have more variation in phenotypes because different combinations of alleles for these genes produce many different phenotypes.  
 10. Morgan chose fruit flies because fruit flies are easy to keep in the lab and they reproduce quickly, producing a great number of offspring.

 11. Mitosis produces two cells. Meiosis produces four cells.  
 12. Cells resulting from mitosis have a diploid number of chromosomes and are genetically identical to each other and to the original parent cell. Cells resulting from meiosis have a haploid number of chromosomes and are genetically different from each other and the original parent cell.  
 13. Both products of meiosis I and II are haploid cells. Two cells result from meiosis I, and four cells result from meiosis II.  
 14. Gamete formation in either sex is a result of meiosis. In males, the four cells resulting from meiosis usually all become gametes. In females, however, the cytoplasm is not divided evenly, so that only one of the four cells becomes a gamete. The other cells become polar bodies, which are not used in reproduction.  
 15. Each daughter cell would contain 14 chromosomes.
