Computer Architectures for Spatially Distributed Data Herbert Freeman, G.G. Pieroni, 2013-11-09 These are the proceedings of a NATO Advanced Study Institute ASI held in Cetraro Italy during 6 17 June 1983 The title of the ASI was Computer Architectures for Spatially Distributed Data and it brought together some 60 participants from Europe and America Presented here are 21 of the lectures that were delivered The articles cover a wide spectrum of topics related to computer architecture specially oriented toward the fast processing of spatial data and represent an excellent review of the state of the art of this topic For more than 20 years now researchers in pattern recognition image processing meteorology remote sensing and computer engineering have been looking toward new forms of computer architectures to speed the processing of data from two and three dimensional processes The work can be said to have commenced with the landmark article by Steve Unger in 1958 and it received a strong forward push with the development of the ILLIAC III and IV computers at the University of Illinois during the 1960 s One clear obstacle faced by the

computer designers in those days was the limitation of the state of the art of hardware when the only switching devices available to them were discrete transistors As a result parallel processing was generally considered to be impractical and relatively little progress was made

[A Practical Introduction to Computer Architecture](#) Daniel Page, 2009-04-21 It is a great pleasure to write a preface to this book In my view the content is unique in that it blends traditional teaching approaches with the use of mathematics and a mainstream Hardware Design Language HDL as formalisms to describe key concepts The book keeps the machine separate from the application by strictly following a bottom up approach it starts with transistors and logic gates and only introduces assembly language programs once their execution by a processor is clearly defined Using a HDL Verilog in this case rather than static circuit diagrams is a big deviation from traditional books on computer architecture Static circuit diagrams cannot be explored in a hands on way like the corresponding Verilog model can In order to understand why I consider this shift so important one must consider how computer architecture a subject that has been studied for more than 50 years has evolved In the pioneering days computers were constructed by hand An entire computer could just about be described by drawing a circuit diagram Initially such diagrams consisted mostly of analogue components before later moving toward digital logic gates The advent of digital

electronics led to more complex cells such as half adders ip ops and decoders being recognised as useful building blocks
