Concept Development 37 Key:

Early Category and Concept Development David H. Rakison, Lisa M. Oakes, 2008-12-30 Whether or not infants' earliest perception of the world is a blooming buzzing confusion, it is not long before they come to perceive structure and order among the objects and events around them. At the core of this process and cognitive development in general is the ability to categorize—to group events, objects, or properties together and to form mental representations or concepts that encapsulate the commonalities and structure of these categories. Categorization is the primary means of coding experience underlying not only perceptual and reasoning processes but also inductive inference and language. The aim of this book is to bring together the most recent findings and theories about the origins and early development of categorization and conceptual abilities. Despite recent advances in our understanding of this area, a number of hotly debated issues remain at the center of the controversy over categorization. Researchers continue to ask questions such as: Which mechanisms for categorization are available at birth and which emerge later? What are the relative roles of perceptual similarity and nonobservable properties in early classification? What is the role of contextual variation in categorization by infants and children? Do different experimental procedures reveal the same kind of knowledge? Can computational models simulate infant and child categorization? How do computational models inform behavioral research? What is the impact of language on category development? How does language partition the world? This book is the first to address these and other key questions within a single volume. The authors present a diverse set of views representing cutting-edge empirical and theoretical advances in the field. The result is a thorough review of empirical contributions to the literature and a wealth of fresh theoretical perspectives on early categorization.

Vygotsky and Science Education Colette Murphy, 2022-05-18 This book highlights those aspects of Vygotskian theory which are most cogent to Science Education, including the Zone of Proximal Development (ZPD), concept development, play, and imagination. Whilst these and other Vygotskian constructs apply to both research and practice in all forms of Science Education, this book employs a specific and critical focus on one or two key concepts for each context. Thus, play and imagination are explored in depth in the chapter on science in early childhood learning; the ZPD is considered in depth in the primary school science chapter; and concept development in the secondary level chapter. Chapters on higher education, science learning, and teaching science teacher education, informal science learning, science education research, and the scientific endeavour itself draw on those aspects of Vygotskian theory which relate most closely. This book makes an important contribution to Vygotskian theory. Never before has it been applied so widely and comprehensively to the field of science and STEM education. The book is intended for students and academics in science and STEM education and the social sciences. It is also of interest to Vygotsky scholars and those involved in the analysis of pedagogic practice within and beyond science and STEM education.
