Friction

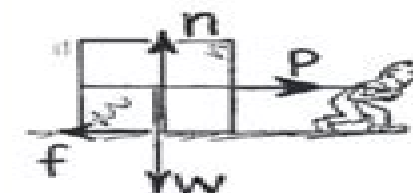

1. A crate filled with delicious junk food rests on a horizontal floor. Only gravity and the support force of the floor act on it, as shown by the vectors for weight W and normal force n .

- The net force on the crate is (zero) (greater than zero).
- Evidence for this is no acceleration.

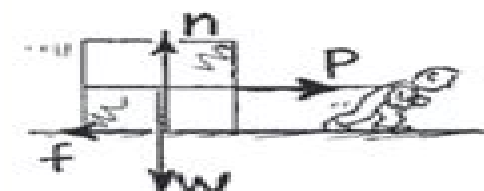

2. A slight pull P is exerted on the crate, not enough to move it.

- The force of friction f acting on the crate is (less than) (equal to) (greater than) P .
- The net force on the crate is (zero) (greater than zero).

3. Pull P is increased until the crate begins to move. It is pulled so that it moves with constant velocity across the floor.

- Friction f is (less than) (equal to) (greater than) P .
- Constant velocity means acceleration is (zero) (greater than zero).
- The net force on the crate is (less than) (equal to) (greater than) zero.

4. Pull P is further increased and is now greater than friction f .

- The net force on the crate is (less than) (equal to) (greater than) zero.
- The net force acts toward the right, so acceleration acts toward the (left) (right).

- If the pulling force P is 150 N and the crate doesn't move, what is the magnitude of f ? 150 N
- If the pulling force P is 200 N and the crate doesn't move, what is the magnitude of f ? 200 N
- If the force of sliding friction is 250 N, what force is necessary to keep the crate sliding at constant velocity? 250 N
- If the mass of the crate is 50 kg and sliding friction is 250 N, what is the acceleration of the crate when the pulling force is 250 N? 0 m/s² 300 N? 1 m/s² 500 N? 5 m/s²

R. Jena,Dr. Sohit Agarwal,2025-05-03 The concept of robots may be seen as highly developed automated systems when viewed from a certain point of view In addition robotics may be seen as both a scientific area and a technology that has emerged from automation via the collaborative efforts of several other fields of endeavour These are some other viewpoints about robotics In general an automated system requires relatively little in the way of intelligence or manipulation yet it may be simply programmed to achieve productivity goals This is because it is able to function without human intervention Additionally it is feasible for the system to do some processes more than once Keeping in mind that the mechanical structure of an automated system often only permits it to do the one task for which it was created is an essential point to bear in mind The capacity of a control unit to be reprogrammed is what determines the degree of flexibility that it possesses in the majority of cases it is simply able to adjust the timing of the actions that have been defined Hardware is responsible for supplying the mechanical capability to carry out an operation of movement and or manipulation that has been predetermined in advance This capability comprises mechanical electrical pneumatic and hydraulic components Hardware is also responsible for giving the capability to carry out the operation Because the control and operation counterpart is composed of software and electrical components the system is able to work independently and with a degree of flexibility This is made possible by the system s capacity to function independently Both of these are necessary elements that make up an automated system and they work together to accomplish their respective functions It is necessary to consider their design and operation as separate but complementary aims in order to attain and maintain optimal performance in an automated system This is because they are so dependent on one another that they are unable to function without one another *Basic Physical Science* Helen Dolman MacCracken,1964 **The Commonwealth Engineer** ,1942 **Journal of Health, Physical Education, Recreation** ,1962 **Scientific American** ,1917 **Armor** ,1970 *Knowledge* ,1913 *Biennial Review of Health Care Management* Grant T.
