

Project – Art with Conics

Conic sections are used in a wide variety of fields and are present in the world around you. You are going to use conic sections to create a work of art. This will require you to identify the presence of curves in familiar images and connect them to mathematical forms. The picture below is a very simple example. Your picture should incorporate greater complexity and creativity.

Directions:

Create a Desmos account if you do not already have one. On graph paper, sketch a rough design that incorporates various curves and shapes related to conic sections. Then create your design in Desmos using mathematical equations. If you wish to replicate an image, you may choose to paste it in Desmos and then create the curves to trace it.

Your work should have at least 15 curves, with at least 2 for each type of conic section. You may include other types of graphs (lines, sine, ...)

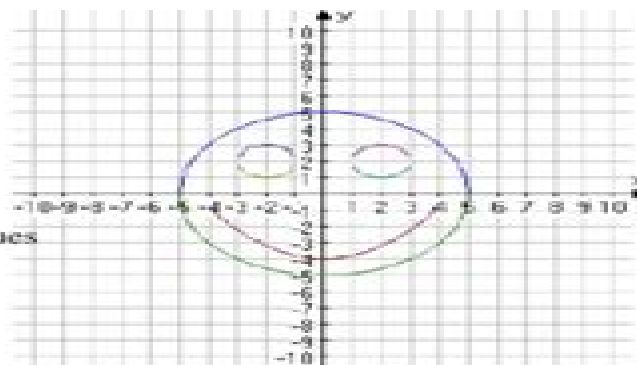

Share your final product with Ms. Jackson at msjacksoncghs@gmail.com. It is recommended that you submit it by 11/22/19, but you may turn it in as late as 11/24/19 with no penalty.

The picture below is a very simple example. Your picture should incorporate greater complexity and creativity.

1. A circle that makes up the outline of the face. The equation of this circle is $x^2 + y^2 = 5^2$.

2. The right eye is a circle with center at (2,2) and radius 1. The equation is $(x-2)^2 + (y-2)^2 = 1$. The left eye

3. The smile is a parabola. The vertex is (0,-4) and the point (2,-3) is on the parabola. By solving for a (show work), you get the equation $y = 3/16 x^2 - 4$. Graph the smile only for x values between -4 and 4. To restrict the domain in Desmos, include $\{-4 \leq x \leq 4\}$ after the equation.

This project will count as a quiz grade. You may search the internet for ideas, but you will receive a 0 if you plagiarize. This includes making minor tweaks to an existing work. See Ms Jackson's website for past works by Cedar Grove students (...More → Student Work)

Conics Project Examples With Equations:

The Universe of Conics Georg Glaeser, Hellmuth Stachel, Boris Odehnal, 2016-03-22 This text presents the classical theory of conics in a modern form. It includes many novel results that are not easily accessible elsewhere. The approach combines synthetic and analytic methods to derive projective affine and metrical properties covering both Euclidean and non-Euclidean geometries. With more than two thousand years of history, conic sections play a fundamental role in numerous fields of mathematics and physics with applications to mechanical engineering, architecture, astronomy, design, and computer graphics. This text will be invaluable to undergraduate mathematics students, those in adjacent fields of study, and anyone with an interest in classical geometry. Augmented with more than three hundred fifty figures and photographs, this innovative text will enhance your understanding of projective geometry, linear algebra, mechanics, and differential geometry with careful exposition and many illustrative exercises.

Classical Mathematics from Al-Khwarizmi to Descartes Roshdi Rashed, 2014-08-21 This book follows the development of classical mathematics and the relation between work done in the Arab and Islamic worlds and that undertaken by the likes of Descartes and Fermat. Early modern mathematics is a term widely used to refer to the mathematics which developed in the West during the sixteenth and seventeenth century. For many historians and philosophers, this is the watershed which marks a radical departure from classical mathematics to more modern mathematics, heralding the arrival of algebra, geometrical algebra, and the mathematics of the continuous. In this book, Roshdi Rashed demonstrates that early modern mathematics is actually far more composite than previously assumed, with each branch having different traceable origins which span the millennium. Going back to the beginning of these parts, the aim of this book is to identify the concepts and practices of key figures in their development, thereby presenting a fuller reality of these mathematics. This book will be of interest to students and scholars specialising in Islamic science and mathematics, as well as to those with an interest in the more general history of science and mathematics and the transmission of ideas and culture.

The Practice of Algebraic Curves David Eisenbud, Joe Harris, 2024-11-09 This textbook provides readers with a working knowledge of the modern theory of complex projective algebraic curves. Also known as compact Riemann surfaces, such curves shaped the development of algebraic geometry itself, making this theory essential background for anyone working in or using this discipline. Examples underpin the presentation throughout, illustrating techniques that range across classical geometric

theory modern commutative algebra and moduli theory The book begins with two chapters covering basic ideas including maps to projective space invertible sheaves and the Riemann Roch theorem Subsequent chapters alternate between a detailed study of curves up to genus six and more advanced topics such as Jacobians Hilbert schemes moduli spaces of curves Severi varieties dualizing sheaves and linkage of curves in 3 space Three chapters treat the refinements of the Brill Noether theorem including applications and a complete proof of the basic result Two chapters on free resolutions rational normal scrolls and canonical curves build context for Green's conjecture The book culminates in a study of Hilbert schemes of curves through examples A historical appendix by Jeremy Gray captures the early development of the theory of algebraic curves Exercises illustrations and open problems accompany the text throughout The Practice of Algebraic Curves offers a masterclass in theory that has become essential in areas ranging from algebraic geometry itself to mathematical physics and other applications Suitable for students and researchers alike the text bridges the gap from a first course in algebraic geometry to advanced literature and active research
