PLATFORM FLOAT ADJUSTMENT

When properly adjusted, the float springs should permit the platform to slide over the ground with minimum pressure, yet override an obstacle and return to ground level. To obtain this adjustment, follow carefully the steps below:

1. Lower the platform to the ground.

2. Back off the jam nut at "N" in Illustr. 11A, and turn the bolt at "P" until the spring pivots the upper arm "R" of the float spring bracket to its maximum height, without extending the spring. Adjust left and right springs similarly.

NOTE: The clevis at "S" in Illustr. 11A, should be assembled to the float spring bracket in the center hole on 10-1/2, 16-1/2 and 19-1/2 ft. machines, and in the rear hole on the 13-1/2 ft. machine. For additional floatation, the clevis may be moved forward to the next hole.

3. Start the engine. Press the hydraulic control pedal briefly once or twice to extend the lift cylinders without raising the platform from the ground. This action must be sufficient to pivot the lower arm "T" of the float spring bracket rearward to contact the stop bar on the chassis leg.

4. Extend the left and right float springs by turning the bolt at "P". When properly adjusted, the platform can be lifted at the divider point by hand with the same amount of effort on each side. Tighten the jam nut at "N" against the spring plug.

CAUTION: Too much spring tension will result in unnecessary bouncing of the platform.

PLATFORM FLOAT OPERATION

To get full benefit of the platform float springs in field operation, the hydraulic control pedal must be operated correctly.

When the platform is lowered to the ground, the float spring pulls upward on the float spring bracket, collapsing the lift cylinder and extending the lower arm of the bracket forward. In this position, floatation is ineffective.

To obtain effective platform float, press the hydraulic control pedal briefly to extend the platform lift cylinders. The cylinders must be extended sufficiently to rotate the float spring bracket downward close to the stop bar on the chassis leg. In this position, the spring will take most of the load off the platform.

CUTTING RANGE

In the high position, the platform will cut 28" above wheel level. In the low position, the platform can cut 1" below wheel level; this means the platform can drop below the level of the wheels if ground contour permits.

SEAT ADJUSTMENT

Illustr. 11B

HR 5896

When additional spring tension is required to keep the seat from bottoming, turn the knob shown at "A" in Illustr. 11B clockwise, to decrease the spring tension turn the knob counterclockwise. To adjust the seat forward or back push the knob at "B" in Illustr. 11B to the left and slide the seat to the desired position.
