Concepts and Models D.C. Tosteson, 1978-12-01 This Volume forms the cornerstone of this series of four books on Membrane Transport in Biology It includes chapters that address i the theoretical basis of investigations of transport processes across biological membranes ii some of the experimental operations often used by scientists in this field iii chemical and biological properties common to most biological membranes and iv planar thin lipid bilayers as models for biological membranes The themes developed in these chapters recur frequently throughout the entire series Transport of molecules across biological membranes is a special case of diffusion and convection in liquids The conceptual frame of

reference used by investigators in this field derives in large part from theories of such processes in homogeneous phases. Examples of the application of such theories to transport across biological membranes are found in Chapters 2 and 4 of this Volume. In Chapter 2 Sten Knudsen emphasizes a statistical and molecular approach while in Chapter 4 Sauer makes heavy use of the thermodynamics of irreversible processes. Taken together these contributions introduce the reader to the two sets of ideas which have dominated the thinking of scientists working in this field. Theoretical consideration of a more special character are also included in several other Chapters in Volume I. For example Ussing Chapter 3 reworks the flux ratio equation which he introduced into the field of transport across biological membranes in 1949.
