

**Concept-Development
Practice Page****9-1****Work and Energy**

1. How much work (energy) is needed to lift an object that weighs 200 N to a height of 4 m?

800 J

2. How much power is needed to lift the 200-N object to a height of 4 m in 4 s?

200 W

3. What is the power output of an engine that does 60,000 J of work in 10 s?

6 kW

4. The block of ice weighs 500 newtons.

- a. What is the mechanical advantage of the incline?

2:1

- b. How much force is needed to push it up the incline (neglect friction)?

250 N

5. All the ramps are 5 m high. We know that the KE of the block at the bottom of the ramp will be equal to the loss of PE (conservation of energy). Find the speed of the block at ground level in each case. [Hint: Do you recall from earlier chapters how long it takes something to fall a vertical distance of 5 m from a position of rest (assume $g = 10 \text{ m/s}^2$)? And how much speed a falling object acquires in this time? This gives you the answer to Case 1. Discuss with your classmates how energy conservation gives you the answers to Cases 2 and 3.]

Case 1: Speed = 10 m/s Case 2: Speed = 10 m/s Case 3: Speed = 10 m/s

Block on A reaches bottom first; greater acceleration and less ramp distance. Although it will have the same speed at bottom, the time it takes to reach that speed is different!

Advanced Classical Electromagnetism Robert Wald, 2022-02-01 A modern approach to classical electromagnetism Electromagnetism is one of the pillars of modern physics Robert Wald provides graduate students with a clear concise and mathematically precise introduction to the subject covering all the core topics while bringing the teaching of electromagnetism up to date with our modern understanding of the subject Electromagnetism is usually taught in a quasi

historical fashion starting from concepts formulated in the eighteenth and nineteenth centuries but this tends to promote outdated ways of thinking about the theory Wald begins with Maxwell's equations the foundation of electromagnetism together with the formulas for the energy density momentum density and stress tensor of the electromagnetic field He then proceeds through all the major topics in classical electromagnetism such as electrostatics dielectrics magnetostatics electrodynamics and radiation diffraction and special relativity The last two chapters discuss electromagnetism as a gauge theory and the notion of a point charge topics not normally treated in electromagnetism texts Completely rethinks how to teach electromagnetism to first year graduate students Presents electromagnetism from a modern mathematically precise perspective formulating key conceptual ideas and results clearly and concisely Written by a world class physicist and proven in the classroom Covers all the subjects found in standard electromagnetism textbooks as well as additional topics such as the derivation of the initial value formulation for Maxwell's equations Also ideal as a supplementary text or for self study
