

Classical Physics Model: Gravitational interaction

Note that Newton almost thought of the gravitational force exerted on you by the planet you're standing on, usually the Earth. That quantity is a force exerted by all the mass within that planet and the Earth, so this rather "big" say that the gravitational force is calculated on this Earth, not just from about where influences the magnitude of the gravitational force.

Newton's law of universal gravitation

All masses in the universe are attracted to each other by a gravitational force. Given two masses, m_1 and m_2 , separated by a distance r , the magnitude of the gravitational force is calculated as follows:

$$F = G \frac{m_1 m_2}{r^2}$$

The gravitational force between the two masses is always attractive (pulls them together).

The magnitude of the gravitational force F between two masses is directly proportional to the product of the masses m_1 and m_2 and inversely proportional to the square of the distance r between the masses. This relationship is summarized by the equation:

$$F \propto \frac{m_1 m_2}{r^2}$$

G is a constant of proportionality called the Gravitational Constant, equal to $6.67 \times 10^{-11} \text{ N m}^2/\text{kg}^2$. This equation is known as Newton's law of universal gravitation. It was discovered by the English astronomer and physicist Isaac Newton.

1. The diagram shows a 1 kg mass and a 2 kg mass separated by a distance of 1 m.

2. Calculate the magnitude of the gravitational force between the two masses.

3. Calculate the magnitude of the gravitational force on the 1 kg mass.

4. Calculate the magnitude of the gravitational force on the 2 kg mass.
