Concept Development 8 2:

Early Category and Concept Development David H. Rakison, Lisa M. Oakes, 2008-12-30 Whether or not infants' earliest perception of the world is a blooming buzzing confusion, it is not long before they come to perceive structure and order among the objects and events around them. At the core of this process and cognitive development in general is the ability to categorize—to group events, objects, or properties together and to form mental representations or concepts that encapsulate the commonalities and structure of these categories. Categorization is the primary means of coding experience underlying not only perceptual and reasoning processes but also inductive inference and language. The aim of this book is to bring together the most recent findings and theories about the origins and early development of categorization and conceptual abilities. Despite recent advances in our understanding of this area, a number of hotly debated issues remain at the center of the controversy over categorization. Researchers continue to ask questions such as: Which mechanisms for categorization are available at birth and which emerge later? What are the relative roles of perceptual similarity and nonobservable properties in early classification? What is the role of contextual variation in categorization by infants and children? Do different experimental procedures reveal the same kind of knowledge? Can computational models simulate infant and child categorization? How do computational models inform behavioral research? What is the impact of language on category development? How does language partition the world? This book is the first to address these and other key questions within a single volume. The authors present a diverse set of views representing cutting-edge empirical and theoretical advances in the field. The result is a thorough review of empirical contributions to the literature and a wealth of fresh theoretical perspectives on early categorization.

Supported Cooperative Work in Design IV Weiming Shen,Jianming Yong,Yun Yang,Jean-Paul A. Barthès,Junzhou Luo,2008-12-18 Design of complex artifacts and systems requires the cooperation of multidisciplinary design teams using multiple sophisticated commercial and non commercial engineering tools such as CAD tools modeling simulation and optimization software engineering databases and knowledge based systems Individuals or individual groups of multidisciplinary design teams usually work in parallel and independently with various engineering tools which are located on different sites often for quite a long period of time At any moment individual members may be working on different versions of a design or viewing the design from various perspectives at different levels of details In order to meet these requirements it is necessary to have efficient computer supported collaborative design systems These systems should not only automate individual tasks in the manner of traditional computer aided engineering tools but also enable individual members to share information collaborate and coordinate their activities within the context of a design project Based on close international collaboration between the University of Technology of Compiègne in France and the Institute of Computing Technology of the Chinese Academy of Sciences in the early 1990s a series of international workshops on CSCW in Design started in 1996 In order to facilitate the organization of these workshops an International Working Group on CSCW in Design CSCWD was established and an International Steering Committee was formed in 1998 The series was converted to international conferences in 2000 building on the success of the four previous workshops *Architectural Interior Systems* John Edward Flynn,1992 A guide to applying building system engineering and design considerations to aspects of the created environment that affect human sensory response behavior productivity and impressions of well being A general reference for architects and interior designers and suitable as an introductory text for students in those fields Annotation copyright

Theoretical Nursing Afaf Ibrahim Meleis,2011 An additional assumption was that the processes for theory development were new to nursing and hence nurses in graduate programs learned strategies for advancing knowledge from other disciplines This assumption was debunked with the knowledge that nurses were always engaged in knowledge development driven by their experiences in clinical practice Because of these assumptions most of the early writing about theory development was about outlining strategies that should be used rather than strategies that have already been used in the discipline to develop theories Theorists themselves did not uncover or adequately discuss ways by which they developed their theories therefore the tendency was to describe processes that were based on theories developed in other disciplines mainly

the physical and social sciences And an implicit assumption was made that there should be a single strategy for theory development some claiming to begin the process from practice and others believing it should be driven by research Provided by publisher
