

5. Projectile Motion

Study Design

- investigate and analyse theoretically and practically the motion of projectiles near Earth's surface, including a qualitative description of the effects of air resistance

Introduction

A projectile is a body that has been thrown or projected, and is travelling freely through the air. While undergoing projectile motion the object is under the constant unbalanced force of gravity. When we study projectile motion, no consideration is given to the force projecting the body or to what happens when it lands. Air resistance is considered to be negligible (in quantitative questions), but can be taken into consideration in qualitative questions. The projectile will travel either: vertically or inclined, depending on the initial angle of projection.

The vertical and horizontal motions are treated independently. Usually the vertical motion is treated first, since it determines how long the projectile is in the air.

For both the vertical and inclined projectiles:

- the only force acting is the weight, ie. the bodies are in free fall
- acceleration is **always** 9.8 ms^{-2} downward, (including the point C)
- the instantaneous velocity is tangential to the path
- the total energy (KE & PE) is constant
- between any two points $\Delta KE = -\Delta PE$
- paths are symmetrical for time eg. $\Delta t \text{ (A to B)} = \Delta t \text{ (D to E)}$;
 $\Delta t \text{ (A to C)} = \Delta t \text{ (C to E)}$
- paths are symmetrical for speed eg. speed at A = speed at E; speed at B = speed at D.
- for vertical motion $v_c = 0$, for inclined motion $v_c \neq 0$.

Inclined or oblique projections

- the only force acting is vertically down, so the acceleration and change in velocity are vertical.
- horizontally there is no component of force, so constant horizontal velocity.
- Maximum range is when angle of projection is 45°
