Axially Loaded Cold Formed Steel Columns Strengthened With CFRP Sreedhar Kalavagunta, Sivakumar Naganathan, Kamal Nasharuddin Bin Mustapha, 2014-11-04 This book presents a series of experimental and theoretical studies aimed at the development of a design guideline for CFRP strengthened CFS structures Thin elements may buckle locally at a stress level lower than the yield stress of steel when they are subjected to compression in flexural bending and axial compression This can be controlled to some extent by strengthening the steel members with Carbon Fiber Reinforced Polymer CFRP sheets to improve buckling resistance For purpose of validation the results based on proposed design equation from North American specification for the design of cold formed steel structural members and Euro code for cold formed members are compared against experimental data It has been observed that there is significant increase in strength due to CFRP strengthening Bond strength between CFRP and steel plates has also been studied to investigate effective bond length

The first section examines the effect of adding CFRP plates to the column flanges when buckling about the weak axis Twelve columns with a slenderness ratio of 197 were tested of which nine were strengthened with CFRP The main parameters tested were the level of initial out of straightness length L 8387 to L 1020 CFRP modulus 168 to 430 GPa CFRP reinforcement ratio 13% to 34% and the length of CFRP plate 33% to 95% of L The gain in axial strength due to CFRP retrofitting ranged from 11% to 29% depending on the various parameters The gain generally increased as CFRP modulus initial out of straightness or CFRP reinforcement ratio increased Global buckling consistently governed the maximum load In the case of the 430 GPa CFRP buckling was followed by CFRP crushing in compression then rupture in tension The second section of the thesis examines the effect of CFRP plates

added to the flanges and tested for buckling in the strong axis Eight columns with a slenderness ratio of 83 were tested of which five were strengthened with CFRP The main parameters examined were the level of initial out of straightness L 28889 to L 1635 CFRP modulus 168 to 430 GPa CFRP reinforcement ratio 13% to 34% and the axis of bending The gain in axial strength due to CFRP retrofitting ranged from 0% to 25% depending on the various parameters The gain generally increased as initial out of straightness or CFRP reinforcement ratio increased The higher modulus did not perform as expected showing no gain in strength because the compressive strains were too large and the CFRP crushed before the specimen experienced any gain Specimens compared with the weak axis strengthened with normal modulus CFRP had similar percentage gains in strength
