

An Introduction to Big Data

by John E. Grable, PhD, CFP
Angela C. Lyons, PhD

ABSTRACT

This column provides an introduction to the use of big data and data analytics within the financial services profession. Although the concept of big data is not new, the tools and techniques used to analyze large data sets are becoming more sophisticated and precise. Based on new methodologies, it is likely that big data will fundamentally change the way in which financial advisors practice in the future.

You have probably heard the term “big data.” If you are wondering what big data means, you are not alone. Generally, big data refers to large data sets, collected by firms and governments, that are so large and complex that traditional data processing methods are inadequate to deal with the calculations needed to make sense of the data. These data sets are extremely valuable because of the vast information hidden within the data structures. When analyzed computationally, big data can provide more precise insights into hidden patterns, trends, and associations, especially in the context of human decision making.

The term big data was coined by Doug Laney in the early 2000s.¹ Laney’s definition includes three concepts:

1. **Volume:** the type and detail of data being collected. Before the explosion in computing power, businesses and governments collected data but had a challenging time storing what was collected. Today, the volume of data collected from consumers and by agencies continues to grow, but because of computing capacity, storage is no longer an issue. This means that firms and agencies no longer have a data problem but instead have a computing puzzle.
2. **Velocity:** the speed at which data are collected. Data are no longer lagged. Instead, data are being collected in real time at incredibly fast rates.
3. **Variety:** the types of data being collected. Whereas basic demographic data, attitudes and

Deriving a big data analytics framework. Approaching the project management process for big data initiatives

Theres Mitscherling, 2019-10-09 Master s Thesis from the year 2018 in the subject Computer Science Commercial Information Technology grade 7 Queensland University of Technology Faculty of Science and Engineering course Master in Business Process Management language English abstract This thesis investigates the project management approach for big data projects for industry partner Red Rocks Company The aim of this project is to understand best practice project management for big data initiatives and to develop a framework to help such projects to deliver the expected advantages A brief literature review is undertaken to find out how big data projects are managed From this a Big Data Analytics Framework is derived which is based on CRISP DM The framework is validated through interviews with stakeholders from the corporate sector For this case study the first three phases of the Business Process Management Lifecycle are applied process discovery analysis and design Key findings of the case study are that literature recommends an

agile project management approach for big data initiatives On the contrary the majority of interviewed industry stakeholders confirms a waterfall approach is conducted more often to deliver such projects The developed Big Data Analytics Framework will add significant benefits to Red Rocks Company as it will help to successfully deliver big data initiatives in future Big data is considered a key enabler for future decision making and process automation The topic is however very new and not well understood yet Hence 50% of big data projects are not delivering the expected benefits and are costing more than initially planned *High-Performance Persistent Storage System for BigData Analysis* Piyush Saxena,2014-08-19 Master s Thesis from the year 2014 in the subject Computer Science Applied grade 82 00 course M Tech CS E language English abstract Hadoop and Map reduce today are facing huge amounts of data and are moving towards ubiquitous for big data storage and processing This has made it an essential feature to evaluate and characterize the Hadoop file system and its deployment through extensive benchmarking We have other benchmarking tools widely available with us today that are capable of analyzing the performance of the Hadoop system but they are made to either run in a single node system or are created for assessing the storage device that is attached and its basic characteristics as top speed and other hardware related details or manufacturer s details For this the tool used is HiBench that is an essential part of Hadoop and is comprehensive benchmark suit that consist of a complete deposit of Hadoop applications having micro bench marks real time applications for the purpose of benchmarking the performance of Hadoop on the available type of storage device i e HDD and SSD and machine configuration This is helpful to optimize the performance and improve the support towards the limitations of Hadoop system In this research work we will analyze and characterize the performance of external sorting algorithm in Hadoop MapReduce with SSD and HDD that are connected with various Interconnect technologies like 10GigE IPoIB and RDBAIB In addition we will also demonstrate that the traditional servers and old Cloud systems can be upgraded by software and hardware up gradations to perform at par with the modern technologies to handle these loads without spending ruthlessly on up gradations or complete changes in the system with the use of Modern storage devices and interconnect networking systems This in turn reduces the power consumption drastically and allows smoother running of large scale servers with low latency and high throughput allowing use of the utmost power of the processors for the big data flowing in the network *SQL Engines for Big Data Analytics* Ajit Singh,2019-12-09 Master s Thesis from the year 2018 in the subject Computer Science Internet New Technologies grade 8 course Master of Computer Application language English abstract This book aims to describe how data analytics works for big data and how they are used in business It gives an overview of existing technologies and ap proaches to building data analytics infrastructures It also defines points that should be taken into consideration while choosing the most suitable software solution for a particular use case The research is done by studying architectural principles of big data sys tems and investigating the market of data analytics software The result of this work is a composite report including comparison of several technologies and a list of criteria considered The final report

can be used as a guideline for choosing the most suitable technology for implementing an analytical platform in a broad variety of organizations. With a growing amount of data generated, their changing and evolving the concept of big data has become incredibly popular in last years. It provides a set of new approaches and techniques allowing to work efficiently with huge volumes of records. Nowadays information is one of the most important resources it can help with decision making and business processes optimization. However to get actual insights and unlock a potential of data it is necessary to process them and discover the information hidden inside it which is a goal of data analytics. Data analytic platforms allow to manipulate with raw data in order to find out what exactly they contain. These systems are complex and includes multiple components therefore their designing requires comprehensive analysis of available options.
