# How to Make a Lava Lamp

## What Happened

A lava lamp works because of two different scientific principles: density and polarity.

Density is the measurement of how compact a substance is. The denser it is, the more it will sink to the bottom of a liquid.

If you mix oil and water, you'll find that the oil is heavier than the water. This is because oil is less dense than water. So it will sink to the bottom of the water.

When you add food coloring to the oil, the coloring will sink to the bottom of the oil. This is because the coloring is more dense than the oil.

When you shake the bottle, the oil and water will mix together. The coloring will be in the water. This is because the coloring is more dense than the water. So it will sink to the bottom of the water.

Oil and water are immiscible, meaning they don't mix. This is because they have different polarities. Oil is non-polar, meaning it doesn't have a positive or negative charge. Water is polar, meaning it has a positive and negative charge. This is why oil and water don't mix.

When you add food coloring to the oil, the coloring will sink to the bottom of the oil. This is because the coloring is more dense than the oil. When you shake the bottle, the oil and water will mix together. The coloring will be in the water. This is because the coloring is more dense than the water. So it will sink to the bottom of the water.
