How to Make a Lava Lamp

What Happened

A lava lamp works because of two different scientific principles: density and polarity.

Density is the measurement of how compact a substance is. The denser it is, the more it will sink.

If you mix oil and water, you'll find that the water is heavier than the oil. Water is heavier than oil, so it will sink to the bottom of the oil.

Adding food coloring to the oil and water will create a beautiful mixture. The colors will be "polar" because they have a chemical change that allows them to mix.

Oil molecules, however, are non-polar. They don't have a positive charge, so they are not attracted to the water molecules at all. This is why oil and water don't mix. Instead of mixing, a light color is created. The oil and water are still separate, but the colors are mixed. The colors are mixed, but the oil and water are still separate. The colors are mixed, but the oil and water are still separate. The colors are mixed, but the oil and water are still separate.
