The gateway and endpoint nodes communicate over multiple wireless channels within the 902-928MHz ISM Spectrum. Different configurations of internal & external antennas and different RF power options allow you to customize the wireless range from a few feet to > 10000'. The implementation of FHSS methodology allows for reliable communications even in harsh industrial environments. The gateway station and endpoint nodes communicate with acknowledge handshaking to verify reception of data. Error checking is also performed to validate the data transmission.

The Gateway and Endpoint node communications always collect signal strength information. The collected data can help gauge the strength and performance of the wireless signals. The received signal strength can be adjusted by various parameters such as the TX power settings and Receiver Sensitivity Modes. Hardware configurations can also impact the signal strength, such as internal / external antenna and antenna placement.
