

## Introduction to Genetics

■ In the 1860's, Gregor Mendel was able to demonstrate the "particulate" hypothesis of inheritance, or the gene idea.

☞ Parents pass discrete "heritable factors" (genes) to their offspring. Genes retain their individuality from generation to generation.

How does this differ from the blending model?

### Mendel's Experimental Method

■ Mendel's plants had both female (carpel) and male (stamen) reproductive structures. Normally pea plants self-fertilize.

■ Mendel controlled the parent genes:

1. He prevented self fertilization by removing the stamen
2. He cross-fertilized the female with pollen from another flower
3. He allowed the carpel to develop into a pod containing seeds
4. The seeds grew into offspring plants with a particular character

#### TECHNIQUE

#### RESULTS

### Where did Mendel Begin?

■ Mendel isolated true-breeding varieties, that when self-pollinated, produce offspring identical to the parent for a particular character.
