

Pediatric Dosages

LEARNING OBJECTIVES

On completion of the materials provided in this chapter, you will be able to perform computations accurately by mastering the following mathematical concepts:

- 1 Converting the weight of a child from pounds to kilograms
- 2 Converting the neonate and infant weight from grams to kilograms
- 3 Performing pediatric dosage calculations
- 4 Calculating the single or individual dose of medications
- 5 Determining whether the prescribed dose is safe and therapeutic
- 6 Calculating a safe and therapeutic 24-hour dosage range
- 7 Calculating the single dose range from a 24-hour dosage range
- 8 Determining whether the actual dosage (in milligrams per kilograms per 24 hours) is safe to administer
- 9 Calculating pediatric IV solutions
- 10 Administering IV medications to pediatric patients
- 11 Calculating the daily fluid requirements for infants and young children
- 12 Calculating the body surface area (BSA) for medication administration

Children are more sensitive than adults to medications because of their weight, height, physical condition, immature systems, and metabolism. Nurses who administer medications to infants and children must be vigilant in determining whether the patient is receiving the correct medication. The correct dose is one of the six rights of drug administration: right patient, medication, route, time, dose, and documentation.

The physician or provider will prescribe the medication to be delivered. However, the nurse is responsible for detecting any errors in calculation of dosage, as well as for preparing the medication and administering the drug. The nurse needs to be aware that pediatric dosages are often less than 1 mL; therefore a tuberculin syringe is used for accurate dosing.

Pediatric medications are calculated using the infant or child's kilogram weight. The dosages have been established by the drug companies. Safe and therapeutic (S&T) dosages are readily available from a reliable source such as *The Harriet Lane Handbook*.

In general, pediatric dosages are rounded to the nearest tenth. For infants and young children, doses may be rounded to the nearest hundredth. The child who weighs more than
