contaminants from the system A model of the thermal phenomena that describe coolant hot material interactions was developed to better understand the characteristics of this type of incident The model is described and results for a variety of hypothetical coolant leak incidents are presented It is shown that coolant leak rates above a certain threshold will cause coolant to accumulate in the chamber and evaporation from this pool can maintain positive pressure in the system long after the leak has been stopped Application of the model resulted in reasonably good agreement with the duration of the pressure measured during the incident A closed form analytic solution is shown to be applicable to the initial leak period in which the peak pressures are generated and is presented and discussed
