

Control of Blood Sugar Levels

What hormones are involved in the homeostasis of blood sugar?

Why?

All living things use glucose as a source of energy. In vertebrates it is critical that the levels of glucose in the blood are consistent. Small fluctuations are fine, but if the glucose concentration in the blood gets too high, a coma could result. If the glucose concentration in the blood gets too low, the person could experience seizures, go into a coma or die. In humans, hormone levels help regulate the glucose concentration in the blood and keep us in homeostasis.

Self-management Manik Joshi, 2015-04-25 What is Blood Sugar? The blood sugar glucose level is the amount of sugar glucose present in the blood of human or animals. When blood sugar glucose level rises too high, it's called hyperglycemia. When blood sugar glucose level drops too low, it's called hypoglycemia. **Basic Facts about Blood Sugar** Glucose and Insulin Glucose, a simple sugar, is the primary source of energy for the cells of the body. Glucose comes from the foods (carbohydrates) we eat.

Body converts the carbohydrates into sugar. It is also formed and stored inside the body. After meals, adequate quantity of insulin hormone is automatically released by pancreas. Blood carries the glucose from the intestines or liver to body cells. Insulin makes it possible for cells to take in the glucose from blood. In other words, insulin helps absorption of glucose by cells. Level of blood sugar starts dropping soon after it starts entering the cell. Blood sugar levels fluctuate throughout the day.
