

The Cell Cycle

What controls the life and development of a cell?

Why?

An old piece of poetry says "to everything there is a season... a time to be born, a time to die." For cells, the line might say "a time to divide and a time to grow." In multicellular organisms, different types of cells have different roles and need to complete specific tasks. For example, a cell that isn't large enough is not useful for storing nutrients for later, but a cell that is too large will not be useful for transportation through a tiny capillary. In this activity, you will learn about the seasons of a cell's life, and in turn better understand how organisms function.

Model 1 – The Cell Cycle

1. How many phases are in the cell cycle as shown in the diagram in Model 1?

The cell cycle consists of four main phases

2. Starting at the started cell, what is the order of the stages of a cell's life?
 1. G₁ phase (Gap 1): The cell grows and carries out its normal functions.
 2. S phase (Synthesis): DNA replication occurs during this phase.
 3. G₂ phase (Gap 2): The cell continues to grow and prepares for cell division.
 4. M phase (Mitosis): This phase includes mitosis (nuclear division) and cytokinesis (division of the cytoplasm) and leads to the creation of two daughter cells.
3. During which phase does the size of the cell increase?

During the G₁ phase (gap 1)
4. During which phase does the number of cells increase?

During the Mitosis phase

Control Of The Cell Cycle Pogil:

Cell Cycle Control Michele Pagano, 1998-06-08 Addressing the regulation of the eukaryotic cell cycle this book brings together experts to cover all aspects of the field clearly and unambiguously delineating what is commonly accepted in the field from the problems that remain unsolved It will thus appeal to a large audience basic and clinical scientists involved in the study of cell growth differentiation senescence apoptosis and cancer as well as graduates and postgraduates *Cell Cycle Checkpoint Control Protocols* Howard B. Lieberman, 2008-02-02 The field of cell cycle regulation is based on the observation that the life cycle of a cell progresses through several distinct phases G1 M S and G2 occurring in a well defined temporal order Details of the mechanisms involved are rapidly emerging and appear extraordinarily complex Furthermore not only is the order of the phases important but in normal eukaryotic cells one phase will not begin unless the prior phase is completed successfully Checkpoint control mechanisms are essentially surveillance systems that monitor the events in each phase and assure that the cell does not progress prematurely to the next phase If conditions are such that the cell is not ready to progress for example because of incomplete DNA replication in S or DNA damage that may interfere with chromosome segregation in M a transient delay in cell cycle progression will occur Once the inducing event is properly handled for example DNA replication is no longer blocked or damaged DNA is repaired cell cycle progression continues Checkpoint controls have recently been the focus of intense study by investigators interested in mechanisms that regulate the cell cycle Furthermore the relationship between checkpoint control and carcinogenesis has additionally enhanced interest in these cell cycle regulatory pathways It is clear that cancer cells often lack these checkpoints and exhibit genomic instability as a result Moreover several tumor suppressor genes participate in checkpoint control and alterations in these genes are associated with genomic instability as well as the development of cancer *Cell Cycle Control* W. G. (Ed.) DUNPHY, 1997 *Cell Cycle Control and Dysregulation Protocols* Antonio Giordano, Gaetano Romano, 2008-02-05 *Cell Cycle Control and Dysregulation Protocols* focuses on emerging methodologies for studying the cell cycle kinases and kinase inhibitors It addresses the issue of gene expression in vivo and in vitro the analysis of cyclin dependent kinase inhibitors protein degradation mediated by the proteasome the analysis of the transformed cell phenotype and innovative techniques to detect apoptosis Because there are already many manuals and protocols available along with commercial kits and reagents a variety of the more common techniques have not been included in our book The protocols described based on rather sophisticated techniques for in vivo and in vitro studies consist of molecular biology biochemistry and various types of immunoassays Indeed the authors have successfully accomplished an arduous task by presenting several topics in the simplest possible manner We are confident that *Cell Cycle Control and Dysregulation Protocols* will facilitate and optimize the work of practical scientists involved in researching the cell cycle We greatly acknowledge the extraordinary contribution of the authors in writing this book **Controlling the Cell Cycle (George B. Pegram Lecture Series).**, 2010 The growth

and reproduction of all living organisms are dependent on the cell cycle the process which leads to cell division Uncontrolled division of cells is important for disease particularly cancer Two events S phase and mitosis are common to all cell cycles and are necessary for the two newly divided cells to receive a full complement of genes The onset of S phase and mitosis are controlled by cyclin dependent kinases in all eukaryotes studied from yeast to human beings Checkpoint controls working through the CDKs block cell cycle progression if cells are too small or DNA is damaged or incompletely replicated Recent results from the laboratory on these cell cycle controls will be described

What controls the cell cycle A Murray, **Progress in Cell Cycle Research** Laurent Meijer, Silvana Guidet, Michel Philippe, 2012-12-06 The Progress in Cell Cycle Research series has been conceived to serve as a collection of reviews on various aspects of a fast growing biology field the cell division cycle These reviews do not pretend to cover all aspects of cell cycle regulation and mechanisms but rather focus on a few topics of particular interest in the recent literature This third volume starts with a broad overview of the diversity of ways by which viruses subdue their host cell cycle chapter 1 Of particular interest in this area is the case of HN which has recently been extensively investigated chapter 2 Although most of our understanding of cell cycle regulation derives from work performed in yeast and animal cells plant models reviewed in chapter 3 for one of the best studied example Arabidopsis are starting to contribute significantly to the cell cycle general picture In mammals the regulation of cell division of two types of tissues the intestine chapter 4 and the developing muscle chapter 5 are investigated in an interesting physiological context Cell division is accompanied by a number of morphological changes One of them organelle transport is starting to be better understood chapter 6 The next few chapter summarise our knowledge of some essential regulators of the cell cycle A still intriguing enzyme casein kinase 2 is reviewed in detail in chapter 7 Some of the most studied cell cycle regulators are certainly the CKI s cyclin dependent kinases inhibitors chapter 8

Control Points Within the Cell Cycle , 1984 Evidence of the temporal order of chromosomal DNA replication argues favorably for the view that the cell cycle is controlled by genes acting in sequence whose time of expression is determined by mitosis and the amount of nuclear DNA 2C vs 4C in the cell G1 and G2 appear to be carbohydrate dependent in that cells starved of either carbohydrate or phosphate fail to make these transitions Cells deprived of nitrate however fail only at G1 to S transition indicating that the controls that operate in G1 differ from those that operate in G2 46 references 5 figures
