Create Uml From C Code:

C++ for Artists Rick Miller, 2003 *C For Artists The Art Philosophy and Science of Object Oriented Programming* takes a refreshing and sometimes controversial approach to the complex topic of object oriented programming and the C language. Intended as both a classroom and reference text. *Software Technologies for Embedded and Ubiquitous Systems* Tony Givargis, Stefano Russo, 2008-09-25 Embedded and ubiquitous computing systems have considerably increased their scope of application over the past few years and they now also include mission and business critical scenarios. The advances call for a variety of compelling issues including dependability, real time, quality of service, autonomy, resource constraints, seamless interaction, middleware support, modeling, verification, validation, etc. The International Workshop on Software Technologies for Future Embedded and Ubiquitous Systems (SEUS) brings together experts in the field of embedded and ubiquitous computing systems with the aim of exchanging ideas and advancing the state of the art about the above mentioned issues. I was honored to chair the sixth edition of the workshop which continued the tradition of past editions with high quality research results. I was particularly pleased to host the workshop in the wonderful scenario of Capri with its stunning views and traditions. The workshop started in 2003 as an IEEE event and then in 2007 it became a flagship event of the IFIP Working Group 10.2 on embedded systems. The last few editions held in Hakodate, Japan; Vienna, Austria; Seattle, USA; Gyeongju, Korea; and Santorini, Greece, were co-located with the IEEE International Symposium on Object Component Service Oriented Real Time Distributed Computing (ISORC). This year SEUS was held as a stand-alone event for the first time and despite the additional organizational difficulties, it resulted in a high quality event with papers from four continents: from USA, Europe, East Asia, and Australia, co-authored and presented by senior scientists coming from academia or leading industrial research centers. Design Technology for Heterogeneous Embedded Systems Gabriela Nicolescu, Ian O'Connor, Christian Piguet, 2012-02-02 Design technology to address the new and vast problem of heterogeneous embedded systems design while remaining compatible with standard Moore flows, i.e. capable of simultaneously handling both silicon complexity and system complexity, represents one of the most important challenges facing the semiconductor industry today and will be for several years to come. While the microelectronics industry over the years and with its spectacular and unique evolution has built its own specific design methods to focus mainly on the management of complexity through the establishment of abstraction levels, the emergence of device heterogeneity requires new approaches enabling the satisfactory design of physically heterogeneous embedded systems for the widespread deployment of such systems. *Heterogeneous Embedded Systems* compiled largely from a set of contributions from participants of past editions of the Winter School on Heterogeneous Embedded Systems Design Technology (FETCH) proposes a necessarily broad and holistic overview of design techniques used to tackle the various facets of heterogeneity in terms of technology and opportunities at the physical level: signal representations and different abstraction levels, architectures and components based on hardware and software in all the main phases of design modeling.

validation with multiple models of computation synthesis and optimization It concentrates on the specific issues at the interfaces and is divided into two main parts The first part examines mainly theoretical issues and focuses on the modeling validation and design techniques themselves The second part illustrates the use of these methods in various design contexts at the forefront of new technology and architectural developments

System Design Andreas Gerstlauer, Rainer Dömer, Junyu Peng, Daniel D. Gajski, 2001-05-31 Explains the use of the SpecC language for the rapid design of systems on chip SOCs or embedded systems in general SpecC design allows for starting design from an executable system specification allowing for greater productivity gains To introduce the methodology SpecC is described as an example of a dedicated synthesis oriented system level design language and the four different abstractions levels in systems design are described and refined The methodology is then applied to two examples a voice encoder decoder for mobile telephony and a picture encoder A complete design environment and possible tools which can be developed around the described methodology is then developed Finally the SpecC Technology Open Consortium founded as an effort to promote the language as a worldwide standard for interoperability and IP exchange is introduced Annotation copyrighted by Book News Inc Portland OR
