Is Conflict Adaptation an Illusion? James R Schmidt, Wim Notebaert, Eva Van Den Bussche, 2015-05-20 Conflict adaptation theory is one of the most popular theories in cognitive psychology The theory argues that participants strategically modulate attention away from distracting stimulus features in response to conflict Although results with proportion congruent sequential congruency and similar paradigms seem consistent with the conflict adaptation view some researchers have expressed scepticism The paradigms used in the study of conflict adaptation require the manipulation of stimulus frequencies sequential dependencies time on task regularities and various other task regularities that introduce the potential for learning of conflict unrelated information This results in the unintentional confounding of measures of conflict adaptation with simpler learning and memory biases There are also alternative accounts which propose that attentional adaptation does occur but via different mechanisms such as valence expectancy or effort A significant and often heated debate remains surrounding the question of whether conflict adaptation exists independent of these alternative mechanisms of action The aim of this Research Topic is to provide a forum for current directions in this area considering perspectives from all sides of the debate

Individual Variation and the Bilingual Advantage - Factors that Modulate the Effect of Bilingualism on Cognitive Control and Cognitive Reserve Maurits Van den Noort, Peggy Bosch, Esli Struys, 2020-02-11 The number of bilingual and multilingual speakers around the world is steadily growing leading to the questions How do bilinguals manage two or more language systems in their daily interactions and how does being bilingual multilingual affect brain functioning and vice versa Previous research has shown that cognitive control plays a key role in bilingual language management This hypothesis is further supported by the fact that foreign languages have been found to affect not only the expected linguistic domains but surprisingly other non linguistic domains such as cognitive control attention inhibition and working memory Somehow learning languages seems to affect executive brain functioning In the literature this is referred to as the bilingual advantage meaning that people who learn two or more languages seem to outperform monolinguals in executive functioning skills In this Special Issue we first present studies that investigate the bilingual advantage We also go one step further by focusing on factors that modulate the effect of bilingualism on cognitive control In the second smaller part of our Special Issue we focus on the cognitive reserve hypothesis with the aim of addressing the following questions Does the daily use of two or more languages protect the aging individual against cognitive decline Does lifelong bilingualism protect against brain diseases such as dementia later in life
