DNA Replication and Manipulation

This reading guide is intended to assist your study, directing your attention to the content that will help you meet the Learning Objectives (LOs). There are detailed Learning Objectives at the end if you need extra guidance. Answers to the Self-Assessment Questions are also included.

12.1 DNA Replication (pages 257-263)

In DNA replication, a single parental molecule of DNA produces two daughter molecules.

LO 12.1: Understand the mechanism of DNA replication.

Terminology:

DNA replication

Process of duplicating a DNA molecule, during which the parental strands separate, and new partner strands are made

Template strand

Parental strand whose sequence is used to synthesize a complementary daughter strand

Daughter strand

Strand synthesized from parental template strand

Semiconservative replication

Each strand of a parental DNA duplex serves as a template for the synthesis of a new daughter strand

Replication fork

The site where the parental DNA strands separate as the DNA duplex unwinds

DNA polymerase

An enzyme that is critical component of a large protein complex that carries out DNA replication

Leading strand

Daughter strand has its 3' end pointed toward the replication fork, so as the parental double helix unwinds, this daughter strand can be synthesized as one long, continuous polymer.

Lagging strand

Daughter strand has its 5' end pointed toward the replication fork, so as the parental double helix unwinds a new DNA piece is initiated at intervals and each new piece is elongated at its 3' end until it reaches the piece in front of it.

Okazaki fragment

In DNA replication, any of the many short DNA pieces in lagging strand

Primer

Short stretch of RNA at the beginning of each new DNA strand that serves as a starter for DNA synthesis. Starter in polymerase chain reaction.

RNA primase

An RNA polymerase that synthesizes a short piece of RNA complementary to DNA template and doesn't require a primer.

DNA ligase

Enzyme that uses the energy in ATP to close a nick in a DNA strand, joining the 3' hydroxyl of one end to the 5' phosphate of the other end

Topoisomerase II

Enzyme that breaks a DNA double helix, rotates the ends, and seals the break

Helicase

Chemistry, Study Guide and Solutions Manual T. W. Graham Solomons, Craig B. Fryhle, 2000 On the cover of this book is a Pacific yew tree found in the ancient forests of the Pacific Northwest The bark of the Pacific yew tree produces Taxol found to be a highly effective drug against ovarian and breast cancer Taxol blocks mitosis during eukaryotic cell division The supply of Taxol from the Pacific yew tree is vanishingly small however A single 100 year old tree provides only about one dose of the drug roughly 300 mg For this reason as well as the spectacular molecular architecture of Taxol synthetic organic chemists fiercely undertook efforts to synthesize it Five total syntheses of Taxol have thus far been reported Now a combination of isolation of a related metabolite from European yew needles and synthesis of Taxol from that intermediate supply the clinical demand This case clearly demonstrates the importance of synthesis and the use of organic chemistry It s just one of the many examples used in the text that will spark the interest of students and get them involved in the study of organic chemistry
