

**FIGURE 2.1** A test charge  $q (> 0)$  is moved from the point R to the point P against the repulsive force on it by the charge  $Q (> 0)$  placed at the origin.

to Fig. 2.1, this will happen if  $Q$  and  $q$  are both positive or both negative. For definiteness, let us take  $Q, q > 0$ .

Two remarks may be made here. First, we assume that the test charge  $q$  is so small that it does not disturb the original configuration, namely the charge  $Q$  at the origin (or else, we keep  $Q$  fixed at the origin by some unspecified force). Second, in bringing the charge  $q$  from R to P, we apply an external force  $\mathbf{F}_{\text{ext}}$  just enough to counter the repulsive electric force  $\mathbf{F}_E$  (i.e.  $\mathbf{F}_{\text{ext}} = -\mathbf{F}_E$ ). This means there is no net force on or acceleration of the charge  $q$  when it is brought from R to P, i.e., it is brought with infinitesimally slow constant speed. In

this situation, work done by the external force is the negative of the work done by the electric force, and gets fully stored in the form of potential energy of the charge  $q$ . If the external force is removed on reaching P, the electric force will take the charge away from Q – the stored energy (potential energy) at P is used to provide kinetic energy to the charge  $q$  in such a way that the sum of the kinetic and potential energies is conserved.

Thus, work done by external forces in moving a charge  $q$  from R to P is

$$\begin{aligned} W_{RP} &= \int_R^P \mathbf{F}_{\text{ext}} \cdot d\mathbf{r} \\ &= - \int_R^P \mathbf{F}_E \cdot d\mathbf{r} \end{aligned} \quad (2.1)$$

This work done is against electrostatic repulsive force and gets stored as potential energy.

At every point in electric field, a particle with charge  $q$  possesses a certain electrostatic potential energy, this work done increases its potential energy by an amount equal to potential energy difference between points R and P.

Thus, potential energy difference

$$\Delta U = U_P - U_R = W_{RP} \quad (2.2)$$

(Note here that this displacement is in an opposite sense to the electric force and hence work done by electric field is negative, i.e.,  $-W_{RP}$ .)

Therefore, we can define electric potential energy difference between two points as the work required to be done by an external force in moving (without accelerating) charge  $q$  from one point to another for electric field of any arbitrary charge configuration.

Two important comments may be made at this stage:

- (i) The right side of Eq. (2.2) depends only on the initial and final positions of the charge. It means that the work done by an electrostatic field in moving a charge from one point to another depends only on the initial and the final points and is independent of the path taken to go from one point to the other. This is the fundamental characteristic of a conservative force. The concept of the potential energy would not be meaningful if the work depended on the path. The path-independence of work done by an electrostatic field can be proved using the Coulomb's law. We omit this proof here.
