Bioprocess Engineering Principles Pauline M. Doran, 1995-04-03 The emergence and refinement of techniques in molecular biology has changed our perceptions of medicine agriculture and environmental management Scientific breakthroughs in gene expression protein engineering and cell fusion are being translated by a strengthening biotechnology industry into revolutionary new products and services Many a student has been enticed by the promise of biotechnology and the excitement of being near the cutting edge of scientific advancement However graduates trained in molecular biology and cell manipulation soon realise that these techniques are only part of the picture Reaping the full benefits of biotechnology

requires manufacturing capability involving the large scale processing of biological material. Increasingly biotechnologists are being employed by companies to work in co operation with chemical engineers to achieve pragmatic commercial goals. For many years aspects of biochemistry and molecular genetics have been included in chemical engineering curricula yet there has been little attempt until recently to teach aspects of engineering applicable to process design to biotechnologists. This textbook is the first to present the principles of bioprocess engineering in a way that is accessible to biological scientists. Other texts on bioprocess engineering currently available assume that the reader already has engineering training. On the other hand chemical engineering textbooks do not consider examples from bioprocessing and are written almost exclusively with the petroleum and chemical industries in mind. This publication explains process analysis from an engineering point of view but refers exclusively to the treatment of biological systems. Over 170 problems and worked examples encompass a wide range of applications including recombinant cells, plant and animal cell cultures, immobilised catalysts as well as traditional fermentation systems. First book to present the principles of bioprocess engineering in a way that is accessible to biological scientists. Explains process analysis from an engineering point of view but uses worked examples relating to biological systems. Comprehensive single authored 170 problems and worked examples encompass a wide range of applications involving recombinant plant and animal cell cultures, immobilized catalysts and traditional fermentation systems. 13 chapters organized according to engineering sub disciplines are grouped in four sections: Introduction, Material and Energy Balances, Physical Processes and Reactions, and Reactors. Each chapter includes a set of problems and exercises for the student, key references and a list of suggestions for further reading. Includes useful appendices detailing conversion factors, physical and chemical property data, steam tables, mathematical rules and a list of symbols used. Suitable for course adoption follows closely curricula used on most bioprocessing and process biotechnology courses at senior undergraduate and graduate levels.

Bioprocess Engineering Michael Shuler L., Fikret Kargi, Matthew DeLisa, Chemical and Bioprocess Engineering Ricardo Simpson, Sudhir K. Sastry, 2013-12-04. The goal of this textbook is to provide first year engineering students with a firm grounding in the fundamentals of chemical and bioprocess engineering. However instead of being a general overview of the two topics, Fundamentals of Chemical and Bioprocess Engineering will identify and focus on specific areas in which attaining a solid competency is desired. This strategy is the direct result of studies showing that broad based courses at the freshman level often leave students grappling with a lot of material which results in a low rate of retention. Specifically strong emphasis will be placed on the topic of material balances with the intent that students exiting a course based upon this textbook will be significantly higher on Bloom's Taxonomy knowledge, comprehension, application, analysis and synthesis evaluation, creation relating to material balances. In addition this book also provides students with a highly developed ability to analyze problems from the material balances perspective which leaves them with important skills for the future. The textbook consists of numerous exercises and their solutions. Problems are classified by their level of difficulty. Each chapter

has references and selected web pages to vividly illustrate each example In addition to engage students and increase their comprehension and rate of retention many examples involve real world situations Cell Culture Bioprocess Engineering, Second Edition Wei-Shou Hu,2020-03-06 This book is the culmination of three decades of accumulated experience in teaching biotechnology professionals It distills the fundamental principles and essential knowledge of cell culture processes from across many different disciplines and presents them in a series of easy to follow comprehensive chapters Practicality including technological advances and best practices is emphasized This second edition consists of major updates to all relevant topics contained within this work The previous edition has been successfully used in training courses on cell culture bioprocessing over the past seven years The format of the book is well suited to fast paced learning such as is found in the intensive short course since the key take home messages are prominently highlighted in panels The book is also well suited to act as a reference guide for experienced industrial practitioners of mammalian cell cultivation for the production of biologics Bioprocess Engineering Principles Ross Carlson,Kate Morrissey,Pauline M. Doran,2024-09-27 Bioprocess Engineering Principles Third Edition provides a solid introduction to bioprocess engineering for students with a limited engineering background The book explains process analysis from an engineering perspective using worked examples and problems that relate to biological systems Application of engineering concepts is illustrated in areas of modern biotechnology such as recombinant protein production bioremediation biofuels drug development and tissue engineering as well as microbial fermentation With new and expanded material this remains the book of choice for students seeking to move into bioprocess engineering Includes more than 350 problems that demonstrate how fundamental principles are applied in areas such as biofuels bioplastics bioremediation tissue engineering site directed mutagenesis recombinant protein production and drug development as well as for traditional microbial fermentation Provides in depth treatment of fluid flow turbulence mixing and impeller design reflecting recent advances in our understanding of mixing processes and their importance in determining the performance of cell cultures Focuses on underlying scientific and engineering principles rather than on specific biotechnology applications providing a sound basis for teaching bioprocess engineering Presents new or expanded coverage of such topics as enzyme kinetics downstream processing disposable reactors genetic engineering and the technology of fermentation *BIOPROCESS ENGINEERING* MICHAEL.
