Urban Scaling Luca S. D'Acci,2024-10-29 Urban allometry empirically describes how things for example crime GDP emissions energy use area street length housing prices etc change in cities when their size in terms of population increases Urban scaling is a relatively recent area of urban science investigating how measurable characteristics of cities vary with their sizes This book addresses this relatively novel but highly debated topic within urban studies and geography It presents many results techniques methods and reflections on urban scaling and allometry The sections are organized into different sub areas such as socio economic infrastructural or environmental outputs so that there is a broad organization of the findings into recognizable sub domains The book is particularly timely as it is becoming increasingly urgent and necessary to understand the pro and cons of different city sizes and therefore to plan policies accordingly The book is especially

interesting from a theoretical perspective because it presents the latest developments and achievements in the field which will help to highlight potential universal rules across cities and regions This book will benefit researchers in urban science and scholars entering the field from various disciplines such as geography sociology economics mathematics physics or urban and regional planning It will also find an audience among practitioners and policymakers Chapters 2 13 and 31 of this book are freely available as a downloadable Open Access PDF at <http://www.taylorfrancis.com> under a Creative Commons Attribution Non Commercial No Derivatives CC BY NC ND 4.0 license
