Variation Benedikt Hallgrímsson, Brian K. Hall, 2011-05-04 Darwin's theory of evolution by natural selection was based on the observation that there is variation between individuals within the same species This fundamental observation is a central concept in evolutionary biology However variation is only rarely treated directly It has remained peripheral to the study of mechanisms of evolutionary change The explosion of knowledge in genetics developmental biology and the ongoing synthesis of evolutionary and developmental biology has made it possible for us to study the factors that limit enhance or structure variation at the level of an animal's physical appearance and behavior Knowledge of the significance of variability is crucial to this emerging synthesis Variation situates the role of variability within this broad framework bringing variation back to the center of the evolutionary stage Provides an overview of current thinking on variation in evolutionary biology functional morphology and evolutionary developmental biology Written by a

with substantial amounts of atmospheric nitrogen Chemical protection of crops is a necessity in modern crop management but this treatment has some negative effects as well Therefore scientists are looking for alternative biological ways to control crop pests Against this background specialists from eleven countries discussed the results of their most recent work on the molecular background of microbe plant interactions It appeared that in order to capitalize the recent rapid progress made in the molecular genetical studies on Rhizobium legume and pathogen host plant interactions a multidisciplinary approach is required
