

ATP—The Free Energy Carrier

How does the ATP molecule capture, store, and release energy?

Why?

Expecting people never might accept a \$100 bill for the purchase of a bicycle, but the cashier may well not take a \$100 bill when you buy a package of gum. That is why people often carry smaller denominations in their wallets—it makes everyday transactions easier. The same concept is true for the energy transactions in cells. Cells need energy (often “currency”) to take care of everyday functions, and they need it in many denominations. As humans we can find food for energy, but food molecules provide too much energy for our cells to use all at once. For quick cellular transactions, your cells use energy in the small molecule of ATP. This is analogous to a \$1 bill for your cells’ daily activities.

Model 1 – Adenosine Triphosphate (ATP)

1. The diagram of ATP in Model 1 has three parts. Use your knowledge of biomolecules to label the molecule with an “adenine” section, a “ribose sugar” section, and a “phosphate group” section.
2. Refer to Model 1.
 - a. What is meant by the “tail” in the name adenosine triphosphate?
3. Discuss with your group what the structure of adenosine diphosphate (ADP) might look like. Draw or describe your conclusions.

Model 2 – Hydrolysis of ATP

3. Model 2 illustrates a chemical reaction. Write the reaction as an equation, using the name or abbreviation of each of the two reactants and each of the three products.
4. Consider the structural formula of ATP, ADP and phosphate in Model 2 carefully. What happens to the water from the water molecule during the hydrolysis of ATP?
5. The word **hydrolysis** has two roots, *hydro* and *lysis*. Drawn from this word, what is the chemical reaction illustrated in Model 2?
6. Refer to Model 2.
 - a. Does the hydrolysis of ATP result in a net output, or a net input of energy?
7. Which molecule, ATP or ADP, has a higher potential energy? Explain your reasoning.

have been of ample use in eukaryotes Article in German Hansen Hansen H 2003 In addition to the fundamental interest in understanding modulation of prokaryotic lifestyle by DNA binding proteins As it is well known the antibiotic resistance strains of pathogenic bacteria are a major world problem so that there is an urgent need of innovative technologies to tackle it Most of the patients are infected with the virus It is an imperative of finding new alternatives to the classical way of treatment of bacterial infections and these new alternatives Nevertheless These new alternatives will find a dead end if we are unable to obtain a better understanding of the basic processes modulating bacterial gene expression Our goal is to achieve our understanding of protein DNA interactions First the topic will bring together a lot of very active research in the study of gene replication gene regulation the strategies We therefore want to acquire an in depth knowledge of some of the mechanisms of gene regulation gene transfer and gene replication Further the readers of the papers will realize the importance of the topic and will learn the most recent thinking results and approaches in the area We are fully confident that we have exceeded our expectations Now we are proud to present the final output of the topic which is the eBook It includes 24 articles contributed by 118 authors As of today March 16th January 2017 the total number of readings has reached 19 284 14 921 article views and 2 944 article downloads Long-range Control of Gene Expression Aghajan,Cavallaro,2008 Not Available **Transfer and Expression of Eukaryotic Genes** Harold S. Gene Expression S. R. Kulshrestha, 2007 **Control of Gene Expression**, 1974 **Plastid Proteostasis: Relevance of Transcription, Translation and Post-Translational Modifications** Fiammetta Alagna, Michele Bellucci, Dario Leister, Andrea Pompa, 2017-12-28 Due to their bacterial endosymbiotic origin plastids are organelles with both nuclear encoded and plastid encoded proteins Therefore a highly integrated modulation of gene expression between the nucleus and the plastome is needed in plant cell development Plastids have retained for the most part a prokaryotic gene expression machinery but differently from prokaryotes and eukaryotes they have largely abandoned transcriptional control and switched to predominantly translational control of their gene expression Some transcriptional regulation is known to occur but the coordinate expression between the nucleus and the plastome takes place mainly through translational regulation However

the regulatory mechanisms of plastid gene expression PGE are mediated by intricate plastid nuclear interactions and are still far from being fully understood Although for example translational autoregulation mechanisms in algae have been described for subunits of heteromeric protein complexes and termed control by epistasy of synthesis CES only few autoregulatory proteins have been identified in plant plastids It should be noted of course that PGE in *C reinhardtii* is different from that in plants in many aspects Another example of investigation in this research area is to understand the interactions that occur during RNA binding between nucleus encoded RNA binding proteins and the respective RNA sequences and how this influences the translation initiation process In addition to this the plastid retains a whole series of mechanisms for the preservation of its protein balance proteostasis including specific proteases as well as molecular chaperones and enzymes useful in protein folding After synthesis plastid proteins must rapidly fold into stable three dimensional structures and often undergo co and posttranslational modifications to perform their biological mission avoiding aberrant folding aggregation and targeting with the help of molecular chaperones and proteases We believe that this topic is highly interesting for many research areas because the regulation of PGE is not only of wide interest for plant biologists but has also biotechnological implications Indeed plastid transformation turns out to be a very promising tool for the production of recombinant proteins in plants yet some limitations must still be overcome and we believe that this is mainly due to our limited knowledge of the mechanisms in plastids influencing the maintenance of proteostasis
