**Jing Ying Zhao**

## **Deployable Structures Analysis And Design:**

Deployable Structures Charis J. Gantes, 2001 Deployable structures are prefabricated and can be transformed from a closed compact configuration to a predetermined expanded form in which they are stable and can carry loads This theoretical and practical discussion of deployable structures formulates and solves the complex engineering design problems with which they are associated

**Space Structures 5** G. A. R. Parke, P. Disney, 2002 These Proceedings are based on the Fifth International Conference on Space Structures organised by the University of Surrey Produced as a 2 volume set they contain original and innovative information on space structures from leading engineers and architects from around the world

**Analysis of Deployable Strut Roof Structures** Maxwell Henry Wolfe, Massachusetts Institute of Technology. Department of Civil and Environmental Engineering, 2013 Deployable structures are structures that can change shape from a compact to an expanded form Thus their advantage over conventional structures is adaptability whether in the sense of adapting to changing environmental conditions or being adapted for repeated transportation and deployment These features make deployable structure highly desirable for a wide range of applications in the aerospace military and architectural fields However these structures are often only designed as small scale products rather than structures requiring full analysis and design procedures Much work has focused on the various geometries of the deployment mechanisms without considering practical engineering aspects If deployable structures are to be designed on the scale of large civil structures a proper understanding of the flow of forces through the structure is required This thesis begins with a brief discussion of deployable structures in general before moving on to geometric constraints of strut type deployable structures Then it details a preliminary analysis of one class of deployable structures known as angulated element structures These structures are designed to be operable roofs spanning over sports facilities During deployment the center of the structure opens or closes to accommodate changes in weather conditions Building on the geometry established in other work the relationships between the basic geometric parameters of angulated element rings and their structural characteristics are determined SAP2000 analysis results are used to make specific design recommendations The feasibility of using this type of structure for an operable long span roof is confirmed
