

Figure 4.2.1.6: Facade in the plane of the facade

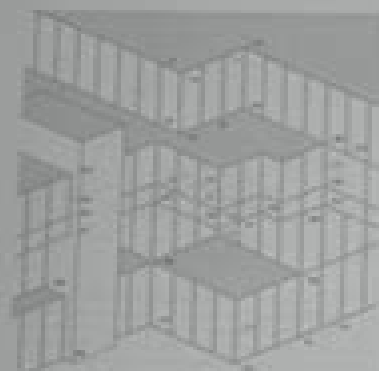

4.2.1.6

Establishing the external three-dimensional geometry of the building, it is worth noting that the enclosing structure is not by its own laws. Every facade is part of a system of structural elements that interact with each other. The shape of the facade is determined by the shape of the building and the position of the facade, whether vertical or inclined or nearly horizontal. These factors influence the architectural design of the facade, its structure and, in particular, its form. At the same time, the facade, in turn, influences the building's structure. Curved facades, for example, require special structural solutions. The three-dimensional conception of the arrangement of these facades seldom applies singly, mostly in combinations with others, for example:

• **three-dimensional geometry of the building** (e.g., creation of recessed and open spaces);

• **efficiency aspects** (e.g., wind resistance, protection, solar A/C and aspects (e.g., water run-off aspects);

• **other aspects.**

4.2.1.7

Approach of different types of surfaces

Vertical surfaces

Water run-off is not hampered, solar and wind problems increase the surface area, and internal edges require proper construction and geometric detailing. Acute angles between adjoining surfaces may cause problems for construction and insulation. The sloping of vertical edges benefits from the fact that they run in the flow direction of facade run-off of water. Folded surfaces can be designed as structurally effective folded plates.

Fig. 4.2.1.7 shows 12 different geometric cases in which facade surfaces intersect with each other or with floor or roof surfaces at edges and corners. A unique detail has to be designed and built for each one of these positions. Points at which more than three different surfaces coincide (e.g., see 2D) are almost impossible to detail properly in terms of engineering and architecture. And if different angles or their curvatures are involved, the number of geometrical and hence constructional cases multiplies considerably.

Folded surfaces

Additional problems arise with every non-vertical surface, especially at corners and joints where significantly angled surfaces. Water run-off is hampered, accumulations of snow and the formation of ice lead to additional loads. Large horizontal surfaces have to be treated like roofs with appropriate drainage, the surface area increases, water-proofing and insulation layers are "disrupted", heat-gaining weak spots in the construction where these layers change direction.

standing facade

4.2.1.8 Schematic view of a standing facade of surface which can be constructed from materials

4.2.1.7 Examples of different facade details based on a uniform, unipolar facade system

4.2.1.8 Schematic diagrams of standing/suspended facade

Every window, door, every vent, every loggia, etc., signifies an effect in the surface (both vertically and horizontally). Furthermore, this results in internal and external edges and corners.

Curved surfaces

When they are vertical, the water run-off is not hampered. In many cases it is not possible to create a continuous curved surface, instead the surface is polygonal due to the shape geometry of the material and semi-finished products used.

Surfaces in double curvature

Such surfaces are not necessarily only encountered with membrane structures. Such geometries are often created as transitional surfaces which can be built as polygons with individual flat facades.

Structural principles

Actions

The facade must safely withstand the forces to which it is subjected and transfer these to the primary loadbearing structure. Every facade design, even a non-loadbearing one, must be conceived and designed as a secondary loadbearing structure to carry the following loads:

- **vertical loads:** dead loads, special loads (e.g., sunshading plants, temporary scaffolds, imposed loads (e.g., persons), snow and ice loads (e.g., to be considered in every case for facade glazing);

suspended facade

4.2.1.9

horizontal loads

- wind load pressure and suction generally occur in the ratio 0.5, but near the edges the suction loads can be considerably greater (imposed loads (e.g., impacts);
- resistant forces, caused by thermal or moisture-related volume changes.

Normally, the loads acting on the facade surfaces are transferred into the floor, walls and columns of the loadbearing structure. Vertical and horizontal loads can be carried and transferred externally into different components of the loadbearing structure.

Standing and suspended facades

One fundamental distinction regarding the loadbearing behavior is whether the facade is supported from below (standing) or from above (suspended), i.e., whether the ground or those components need to be designed for tension and bending, or (compression and bending and hence also buckling stability problems).

The suspended form in which the dead loads are transferred into the loadbearing structure at the top of the facade components (e.g., into the floor slabs) has become widespread worldwide owing to the advantages of this principle:

- The component assumes a stable position immediately after being erected (being in contrast to the imperfect stability of the standing component), which is very important in terms of its safety, especially during the erection of high-rise buildings;
- The self-weight acts as a tensile force along the longitudinal axis of the component. The ensuing pretension has a stabilizing effect (→ lower buckling loads). This avoids the unfavorable superimposition of buckling due to compression and bending.

In the case of long spans in particular, the suspended solution has many advantages over the standing solution. However, deformations perpendicular to the plane of the facade are not reduced by any significant amount.

Anchor points, sliding supports

The facade and the loadbearing structure – at least where these are separate systems – are subjected to different temperature fluctuations and loads and the resulting geometrical changes. This fact calls for an unrestrained coupling between the two, with sliding points and sliding supports. Relative movements in both directions must be accommodated (positive and negative tolerances). The interfaces between the two subsystems usually represent the meeting points between different trades, methods of construction and tolerance ranges. This is why the joints require adequate adjustment options in all directions. Likewise, connections between facade components exhibiting different longitudinal expansion due to mechanical, thermal and moisture-

Facade Construction Manual Thomas Herzog,Roland Krippner,Werner Lang,2012-12-10 Facades they are the first feature of a building to be noticed they determine its distinctive appearance and are often the subject of controversial debate This new first edition of the Facade Construction Manual provides a systematic survey of contemporary expertise in the application of new materials and energy efficient technologies in facade design and represents an invaluable addition to our series of Construction Manuals It surveys the facade design requirements made by various types of buildings as well as the most important materials from natural stone through to synthetics and documents a diversity of construction forms for a wide range of building types Over 100 international case studies in large scale detailed drawings are presented in the comprehensive project section

High-rise Manual Johann Eisele,Ellen Kloft,2003 What constitutes a high rise building A high rise is in fact any building with more than 9 storeys and not just those striking skyscrapers which shape modern city skylines In the past architects who designed such structures

used to be the exception but in the last 10 years more and more architectural offices have begun to focus on this type of building. However, the sheer complexity of designing and planning the construction of a high rise as opposed to other building types requires a wealth of specialized experience and expertise. The High Rise Manual is the first comprehensive reference work on this subject. All relevant aspects of such an undertaking are examined in detail by some 24 specialist authors. Each step is extensively documented including the initial project planning, the building organisation, the laying of the foundations, the supporting structure, the building technology, the office design and the Facility Management. Theoretical contributions present the basic principles of select World Architecture, 2002 *Leading Architecture & Design*, 2005 **Zeitschrift für Architektur & Baudetail**, 2006 **In Detail: High-Density Housing** Christian Schittich, 2004. Building high density housing is a diverse and challenging task for planners and architects. This book presents international projects which document the complexity of the task from the design of the floor plans, the development and use of resources to the use of economically beneficial building systems. Plusminus 20/40 Latitude Dirk U. Hindrichs, Klaus Daniels, 2007-10-09. When looking for appropriate building solutions in tropical and subtropical regions, the chief aim is saving energy and reducing pollutant emissions as much as possible. Natural ventilation, passive and active use of solar energy, use of rainwater and also the energy potential of the soil are the key issues here. Traditional urban and building structures described in an exemplary fashion by local architects for a wide variety of locations provide a stimulus for thinking about positive elements developed by master builders of the past as well alongside all the technical possibilities that exist today. D. Charles Luke Wells, 1912 Numerical Methods and Scientific Computing Norbert Köckler, 1994. This introduction to software packages is written specifically for scientists and engineers who write programmes to get numerical results. It covers the whole range of numerical mathematics from linear equations to ordinary differential equations with short sections on the calculus of error and partial differential equations. As it aims to give a unified approach to theory, algorithms, applications and the use of software, the emphasis is on examples and applications rather than proofs. This book is appearing at the same time as PAN software that contains all the programs described in the book and additional useful software such as help systems and utility tools as well as an enlarged hypertext version of the text. **ACI Manual of Concrete Practice** American Concrete Institute, 2002 **Encyclopedia of Architectural Technology** Jacqueline Glass, 2002-04-03. Constant technological advancements are opening up dramatic new possibilities for the built form at the same time architects are developing innovative designs which require new techniques to make these ideas reality. The Encyclopedia of Architectural Technology is the first book to specifically address these two issues by providing a comprehensive reference to modern architectural technologies encompassing all key aspects of construction, structures, environmental design and servicing. The Encyclopaedia

features over 180 entries ranging from materials and techniques to notable innovators in architecture and engineering Each entry includes a brief quick reference summary followed by a more detailed text and suggestions for further reading Besides technological terms entries are included on related topics such as sick building syndrome and sustainability Key engineers Ove Arup and Ted Happold have dedicated entries as do a range of ground breaking architects such as Le Corbusier Norman Foster Walter Gropius Herzog de Meuron Oscar Niemeyer Richard Rogers Carlo Scarpa Frank Lloyd Wright Ken Yeang and many others
