Digital Transmission: A Simulation Aided Introduction with VisSim Comm is a book in which basic principles of digital communication mainly pertaining to the physical layer are emphasized. Nevertheless, these principles can serve as the fundamentals that will help the reader to understand more advanced topics and the associated technology. In this book, each topic is addressed in two different and complementary ways: theoretically and by simulation. The theoretical approach encompasses common subjects covering principles of digital transmission like notions of probability and stochastic processes, signals and systems, baseband and passband signaling, signal space representation, spread spectrum, multi-carrier and ultra-wideband transmission, carrier and symbol timing recovery, information theory and error-correcting codes. The simulation approach revisits the same subjects focusing on the capabilities of the communication system simulation software VisSim Comm on helping the reader to fulfill the gap between the theory and its practical meaning. The presentation of the theory is made easier with the help of 357 illustrations. A total of 101 simulation files supplied in the accompanying CD support the simulation-oriented approach. A full evaluation version and a viewer-only version of VisSim Comm are also supplied in the CD. *An Introduction to Digital Communications* Jack Kurzweil, 2000. The only book available that integrates a realistic design approach with a theoretical approach. This outstanding new book focuses on the central theoretical and practical issues involved in modem design. The first half deals with the basic issues of baseband and passband data transmission and contains descriptions of applications to specific digital transmission systems. The second half specifically addresses design issues including timing and carrier recovery, channel characterization, adaptive equalization and trellis coding. The author uses simulation programs in Matlab and C to help readers determine the power spectral density of complex data encoding rules, simulate the performance of passband data transmission techniques, design and assess the performance of carrier recovery systems, develop time domain models for a

variety of channels Design and assess the performance of adaptive equalizers Use existing programs as the framework for creating simulation modules **Contemporary Communication Systems Using MATLAB** John G.
