Pratchett,Michael L. Berumen,B. G. Kapoor,2013-09-11 Butterflyfishes family Chaetodontidae are a highly conspicuous component of fish fauna on coral reefs throughout the world In light of their strong dependence on coral they are often regarded as the epitome of coral reef fishes This volume examines the ecology and conservation of coral reef butterflyfishes It provides important insights on their evolution and key events and adaptations that have led to their proliferation within coral reef ecosystems Key to the longevity of butterflyfishes is the evolution of coral feeding a central focus of the ecological chapters in this volume The book also highlights key threats and challenges related to the conservation of butterflyfishes and ends with an overview of current and future research directions

The butterflyfishes: success on the coral reef Philip J. Motta, 2012-12-06 Butterflyfishes of the family Chaetodontidae are conspicuous members of almost all tropical reefs. These colorful fishes have attracted a great deal of attention from both the scientific community and especially the aquarium fish industry. At first one is tempted to say that butterflyfishes are abundant worldwide but the evidence does not support this statement. The biomass of chaetodontids on reefs may range from 0.02 to 0.80% and in terms of numbers they comprise only 0.04 to 0.61% of the individuals on the reef. Yet in spite of these relatively small numbers they have been extensively studied. A quick census shows some 170 articles on or about butterfly fishes with 78% of them being published since the 1970s. Along with the cichlids and damselfishes they might be one of the most studied and well published family of tropical fishes. Why then have chaetodontids attracted so much attention? The butterflyfishes are mostly shallow water inhabitants that are approachable and easily recognizable making their study very feasible. Their bright coloration has provoked many hypotheses but has posed more questions about coloration than it has provided answers. And despite their apparent overall morphological similarity their highly structured and varied social systems have made them an ideal model for such studies. The reasons for choosing these organisms are indeed as diverse as the studies themselves. **A**

Butterflyfishes are amongst the most easily recognizable reef denizens by aquarists and lay people alike. All species are beautifully marked and colored and fancifully shaped. What's more remarkable is their like insect named flitting about from place to place. Some of the best loved marine aquarium specimens are Butterflyfish family members. Where would the marine aquarium hobby be without the raccoon threadfin, teardrop and the several Heniochus Butterflyfish species among others. It would be much poorer certainly. These and several other Butterflyfishes are well suited for captive systems shipping and adjusting well eating all types of foods resisting disease and adapting to a wide range of water conditions. However of the some one hundred twenty nine described species the majority of BF's industry shorthand for Butterflyfishes are best avoided by hobbyists for good reasons. These have proven to suffer from rough handling in collection holding and shipping and adapt poorly to aquarium environments for differing reasons and or require obscure foodstuffs mostly live coral polyps to thrive.
