1. What are two expected features of modern enterprise networks? (Choose two.)

- **support for converged network traffic***
- support for distributed administrative control
- support for 90 percent reliability
- **support for critical applications***
- support for limited growth

All modern enterprise networks are expected to support critical applications, converged network traffic, diverse business needs, and provide centralized administrative control. Users expect enterprise networks to be up 99.999 percent of the time (not 90 percent.). Support for limited growth is not a usual network design criterion.

2. Which type of information is displayed by the show ip protocols command that is issued from a router command prompt?

- the routed protocol that is enabled and the protocol status of interfaces
- **the configured routing protocols and the networks that the router is advertising***
- interfaces with line (protocol) status and I/O statistics
- interface information, including whether an ACL is enabled on the interface

The show ip protocols command displays information about the routing protocols that are configured, the networks the router is advertising, and the default administrative distance. The show interfaces command displays interfaces with line (protocol) status, bandwidth, delay, reliability, encapsulation, duplex, and I/O statistics. The show ip interfaces command displays interface information, including protocol status, the IP address, whether a helper address is configured, and whether an ACL is enabled on the interface. The show protocols command displays information about the routed protocol that is enabled and the protocol status of interfaces.

3. Which action should be taken when planning for redundancy on a hierarchical network design?

- immediately replace a non-functioning module, service or device on a network
- implement STP portfast between the switches on the network
- continually purchase backup equipment for the network
- **add alternate physical paths for data to traverse the network***

One method of implementing redundancy is path redundancy, installing alternate physical paths for data to traverse the network. Redundant links in a switched network supports high availability and can be used for load balancing, reducing congestion on the network.

4. In the Cisco Enterprise Architecture, which two functional parts of the network are combined to form a collapsed core design? (Choose two.)

- **distribution layer***
- enterprise edge
- access layer
