

Automatic Street Light System Project Report

Project Title:

Automatic Street Light System (Without Arduino)

Objective:

To design and construct an automatic street light system that activates in low light conditions without using a microcontroller. This project utilizes semiconductor components to detect ambient light levels and automatically switch on/off street lights.

Introduction

Automatic street lights are energy-efficient lighting systems designed to reduce manual control. These systems use sensors to automatically control the street lights based on ambient light conditions. By turning lights on at dusk and off at dawn, they save energy and reduce costs. This project explores a simple, reliable method using semiconductor physics to automate street lighting without a microcontroller, focusing on the behavior of a Light Dependent Resistor (LDR) and a transistor circuit.

Principle of Operation

The circuit utilizes an LDR and a transistor-based switching circuit. The resistance of the LDR decreases with an increase in light intensity, allowing it to act as a light sensor. In the circuit, when it gets dark, the LDR resistance increases, and a transistor is triggered, turning on the light. As dawn approaches and ambient light increases, the LDR's resistance decreases, turning off the transistor and thereby turning off the light.

Components Used

Light Dependent Resistor (LDR)

Senses ambient light. Resistance increases in darkness and decreases in light, which helps control the flow of current in the circuit. The photoconductive effect of semiconductors is utilized in LDR, where light energy causes changes in electrical resistance.

Transistor (NPN, e.g., BC547 or BC548)

Acts as an electronic switch. The transistor is in an 'off' state when light is detected by the LDR and in an 'on' state in the dark, allowing current to pass to the light source. The transistor's properties enable it to act as a switch, amplifying current from the base to the collector-emitter pathway when triggered by LDR resistance changes.

Relay (5V or 12V, depending on the circuit)

Switches the main power to the street light. The relay is driven by the small current in the transistor circuit, which switches the larger current required by the light source.

Artificial Intelligence and Online Engineering Michael E. Auer, Samir A.

El-Seoud, Omar H. Karam, 2022-10-14. Nowadays online technologies are the core of most fields of engineering and the whole society and are inseparably connected for example with Internet of Things, Industrial Internet of Things, Industry 4.0, Online Biomedical Engineering, Data Science, Machine Learning and Artificial Intelligence, Cross Mixed Reality and Remote Working Environments to name only a few. Since the first REV conference in 2004 we tried to focus on the upcoming use of the Internet for engineering tasks and the opportunities as well as challenges around it. Consequently the motto of this year's REV2022 was Artificial Intelligence and Online Engineering. In a globally connected world the interest in online collaboration, teleworking, remote services and other digital working environments is rapidly increasing. In response to that the general objective of this conference is to contribute and discuss fundamentals, applications and experiences in the field of Online and Remote Engineering, Virtual Instrumentation and other related new technologies like Cross Reality, Data Science, Big Data, Internet of Things, Industrial Internet of Things, Industry 4.0, Cyber Security and M2M Smart Objects. Another objective of the conference is to discuss guidelines and new concepts for engineering education in higher and vocational education institutions including emerging technologies in learning, MOOCs, MOOLs and Open Resources. REV2022 was the 19th in a series of annual events concerning the area of Online Engineering. It has been organized in cooperation with The British University in Egypt (BUE) Cairo as a hybrid event from February 28 until March 02, 2022.
