Design of Enterprise Systems

Ronald E. Giachetti, 2011-05-19 In practice many different people with backgrounds in many different disciplines contribute to the design of an enterprise Anyone who makes decisions to change the current enterprise to achieve some preferred structure is considered a designer What is problematic is how to use the knowledge of separate aspects of the enterprise to achieve a globally optimized enterprise The synthesis of knowledge from many disciplines to design an enterprise defines the field of enterprise engineering Because enterprise systems are exceedingly complex encompassing many independent domains of study students must first be taught how to think about enterprise systems Specifically written for advanced and intermediate courses and modules Design of Enterprise Systems Theory Architecture and Methods takes a system theoretical perspective of the enterprise It describes a systematic approach called the enterprise design method to design the enterprise The design method demonstrates the principles models methods and tools needed to design enterprise systems The author uses the enterprise system design methodology to organize the chapters to mimic the completion of an actual project Thus the book details the enterprise engineering process from initial conceptualization of an enterprise to its final design Pedagogical tools available include For instructors PowerPoint slides for each chapter Project case studies that can be assigned as long term projects to accompany the text Quiz questions for each chapter Business Process Analyzer software available for download For students Templates checklists forms and models to support enterprise engineering activities The book fills a need for greater design content in engineering curricula by describing how to design enterprise systems Inclusion of design is also critical for business students since they must realize the import their decisions may have on the long term

design of the enterprises they work with The book s practical focus and project based approach coupled with the pedagogical tools gives students the knowledge and skills they need to lead enterprise engineering projects

Effective Parameters to Design an Automatic Parking System Hossein Borghei Razavi,Arash Sherafati,2023 The automated parking system is an extensive branch of smart transport systems The smartness of such systems is determined by different parameters such as parking maneuver planning Coding this control system includes vehicle parking and understanding the environment A high quality classification mask has been used on each sample to analyze the automated vehicle parking parameters Mask region based convolutional neural networks R CNN was taught using a small computational workload titled faster R CNN that operates in five frames per second In this paper the rapidly exploring random tree RRT method was used for routing the parking space and a nonlinear model predictive control

NMPC controller was added to develop this system We add the line detection algorithm commands to the mask R CNN algorithm The results can be useful to design a secure automatic parking system as well as a powerful perception system

Car parking system Standard Requirements Gerardus Blokdyk, **Design of Large-scale Smart Parking System**
Xiaotian Wang (Ph.D.),2022 The rapid development of information and communication technology has enabled various advances in smart parking studies where a large portion of the interest is focused on parking reservation systems Parking reservation systems are effective in allocating parking demand and reducing cruising traffic However major existing challenges can be summarized as follows 1 Mitigating the service failure caused by the high uncertainty of customer arrivals and departures 2 Reducing parking reservation system s high dependency on pre installed infrastructure e g sensors in obtaining parking availability information 3 Considering the parking system as a two sided market and exploring its benefits 4 Providing the optimal pricing scheme under the variation of demand over time My dissertation research focuses on developing mathematical models for design and analysis of large scale smart parking systems especially on addressing above challenges First to mitigate the service failure caused by random late departures of customers we propose a new flexible reservation mechanism in which the reservation is no longer restricted to a specific location at a specific time but tolerates predetermined spatiotemporal flexibility instead With a pricing instrument designed for such parking flexibility customers can coordinate to significantly reduce the reservation failure rate resulting in an optimal system equilibrium benefiting the entire society Due to the complex nature of this system a continuum approximation framework is used to provide tractable analysis for a large scale urban parking system We can successfully provide accurate system management decision support with a bounded optimality gap and analytical insights Then we propose a sensor free parking exchange platform where parking availability information is provided by the departing customers and purchased by the arriving customers A centralized pricing scheme is designed to control the demands of both sides and restrict the possible waiting time and relocation distance Due to the complex two sided queue nature of the platform dimensional analysis methods are used to simplify the problem structure based on which an efficient continuum approximation method is developed Some interesting managerial insights are revealed from sensitivity analysis and a realistic case study Finally we consider the pricing problem for managing a parking charging station under the variation of demand Different from the previous work the heterogeneity in customers parking length is considered A two sided market is established and the platform aims to provide the optimal pricing scheme for profit maximization Numerical studies are conducted based on realistic data and sensitivity analysis further leads to interesting insights
