ICIPEG 2016 Mariyamni Awang, Berihun Mamo Negash, Nur Asyraf Md Akhir, Luluan Almannan Lubis, Abdul Ghani Md. Rafek, 2017-01-20 This book presents the proceedings of the 4th International Conference on Integrated Petroleum Engineering and Geosciences 2016 ICIPEG 2016 held under the banner of World Engineering Science Technology Congress ESTCON 2016 at Kuala Lumpur Convention Centre from August 15 to 17 2016 It presents peer reviewed research articles on exploration while also exploring a new area shale research In this time of low oil prices it highlights findings to maintain the exchange of knowledge between researchers serving as a vital bridge builder between engineers geoscientists academics and industry **World Oil**, 1987 *SPE Reservoir Evaluation & Engineering*, 2010 **Rock Mechanics and Rock Engineering: From the Past to the Future** Reşat Ulusay, 2016-11-18 Rock Mechanics and Rock Engineering From the Past to the Future contains the contributions presented at EUROCK2016 the 2016 International Symposium of the International Society for Rock Mechanics ISRM 2016 Cappadocia Region Turkey 29-31 August 2016 The contributions cover almost all aspects of rock mechanics and rock engineering from theories to engineering practices emphasizing the future direction of rock engineering technologies The 204 accepted papers and eight keynote papers are grouped into several main sections Fundamental rock mechanics Rock properties and experimental rock mechanics Analytical and numerical methods in rock engineering Stability of slopes in civil and mining engineering Design methodologies and analysis Rock dynamics rock mechanics and rock engineering at historical sites and monuments Underground excavations in civil and mining engineering Coupled processes in rock mass for underground storage and waste disposal Rock mass characterization Petroleum geomechanics Carbon dioxide sequestration Instrumentation monitoring in rock engineering and back analysis Risk management and the 2016 Rocha Medal Lecture and the 2016 Franklin Lecture Rock Mechanics and Rock Engineering From the Past to the Future will be of interest to researchers and professionals involved in the various branches of rock mechanics and rock engineering EUROCK 2016 organized by the Turkish National Society for Rock Mechanics is a continuation of the successful series of ISRM symposia in Europe which began in 1992 in Chester UK *Efficient Simulation of Thermal Enhanced Oil Recovery Processes* Zhouyuan Zhu, 2011 Simulating thermal processes is usually computationally expensive because of the complexity of the problem and strong nonlinearities encountered In this work we explore novel and efficient simulation techniques to solve thermal enhanced oil recovery problems We focus on two major topics the extension of streamline simulation for thermal enhanced oil recovery and the efficient simulation of chemical reaction kinetics as applied to the in situ combustion process For thermal streamline simulation we first study the extension to hot water flood processes in which we have temperature induced viscosity changes and thermal volume changes We first compute the pressure field on an Eulerian grid We then solve for the advective parts of the mass balance and energy equations along the individual streamlines accounting for the compressibility effects At the end of each global time step we account for the nonadvective

terms on the Eulerian grid along with gravity using operator splitting We test our streamline simulator and compare the results with a commercial thermal simulator Sensitivity studies for compressibility gravity and thermal conduction effects are presented We further extended our thermal streamline simulation to steam flooding Steam flooding exhibits large volume changes and compressibility associated with the phase behavior of steam strong gravity segregation and override and highly coupled energy and mass transport To overcome these challenges we implement a novel pressure update along the streamlines a Glowinski scheme operator splitting and a preliminary streamline finite volume hybrid approach We tested our streamline simulator on a series of test cases We compared our thermal streamline results with those computed by a commercial thermal simulator for both accuracy and efficiency For the cases investigated we are able to retain solution accuracy while reducing computational cost and gaining connectivity information from the streamlines These aspects are useful for reservoir engineering purposes In traditional thermal reactive reservoir simulation mass and energy balance equations are solved numerically on discretized reservoir grid blocks The reaction terms are calculated through Arrhenius kinetics using cell averaged properties such as averaged temperature and reactant concentrations For the in situ combustion process the chemical reaction front is physically very narrow typically a few inches thick To capture accurately this front centimeter sized grids are required that are orders of magnitude smaller than the affordable grid block sizes for full field reservoir models To solve this grid size effect problem we propose a new method based on a non Arrhenius reaction upscaling approach We do not resolve the combustion front on the grid but instead use a subgrid scale model that captures the overall effects of the combustion reactions on flow and transport i e the amount of heat released the amount of oil burned and the reaction products generated The subgrid scale model is calibrated using fine scale highly accurate numerical simulation and laboratory experiments This approach significantly improves the computational speed of in situ combustion simulation as compared to traditional methods We propose the detailed procedures to implement this methodology in a field scale simulator Test cases illustrate the solution consistency when scaling up the grid sizes in multidimensional heterogeneous problems The methodology is also applicable to other subsurface reactive flow modeling problems with fast chemical reactions and sharp fronts Displacement front stability is a major concern in the design of all the enhanced oil recovery processes Historically premature combustion front break through has been an issue for field operations of in situ combustion In this work we perform detailed analysis based on both analytical methods and numerical simulation We identify the different flow regimes and several driving fronts in a typical 1D ISC process For the ISC process in a conventional mobile heavy oil reservoir we identify the most critical front as the front of steam plateau driving the cold oil bank We discuss the five main contributors for this front stability instability viscous force condensation heat conduction coke plugging and gravity Detailed numerical tests are performed to test and rank the relative importance of all these different effects
