

Question:

Newton's Law of Universal Gravitation states that

- a. There is a force of gravitational attraction between all objects that have mass.
- b. The force of gravity can act both as an attraction and as a repulsion.
- c. Masses have the effect of distorting space-time in their vicinity.
- d. The force of gravity between two masses increases in direct proportion to the distance between them.
- e. The force of gravity between two masses increases in direct proportion to the square of the distance between them.

Answer:

The correct answer is *a*. Newton's Law of Universal Gravitation, published in his groundbreaking *Philosophiae Naturalis Principia Mathematica* in 1687, is summarized in this mathematical expression:

$$F = G \frac{m_1 m_2}{r^2}$$

The equation states that the Force of gravitational attraction between any two masses is dependent upon, and proportional to, the masses of the two objects, m_1 and m_2 . It is also inversely proportional to the square of the distance between the two objects, r .

It has been suggested that Newton stumbled upon the idea of an attractive Force between masses by considering the accelerations of an apple falling near the surface of the earth, and the centripetal acceleration of the moon as it "falls" toward the center of the earth that it circles. Even as he worked to develop a form of the expression above that satisfactorily offered evidence of the factors affecting gravitational attraction, Newton was uncomfortable with the idea that a gravitational force could act "at a distance" through space.
