**Directions:** *On the line before each definition, write the letter of the term that matches it correctly. Each term is used only once.*

|---|---------------------------|
| _____ 1. the starting point used to locate another place or thing                         | <b>A.</b> reference point |
| _____ 2. the distance an object moves in a unit of time                                   | <b>B.</b> speed           |
| _____ 3. describes an object's distance and direction from a reference point              | <b>C.</b> position        |

| _____ 5. the difference between the initial, or starting position, and the final position | <b>E.</b> distance        |

Moving objects do not usually maintain a constant speed during an entire journey. The exact speed changes over time. We simplify this situation by describing the object's average speed. Average speed is equal to the total distance traveled divided by the total time.

$$\text{average speed} = \frac{\text{total distance}}{\text{total time}}$$

A bicyclist travels 18 km in 45 minutes. What is the bicyclist's average speed in km/minute?

Step 1 Identify the values given in the problem.

total distance = 18 km

total time = 45 min

Step 2 Put the values into the formula and divide to solve.

$$\text{average speed} = \frac{\text{total distance}}{\text{total time}}$$

average speed = 18km/45 minutes

average speed = 0.4 km/min
