Transcriptional Control

Specification Link: Genomes 6.3.3

Transcription:
This is the first stage of gene expression. It is the process by which the information in a gene is used to produce a messenger RNA (mRNA) molecule. This is a single strand of RNA that carries the genetic code for the protein. The process is controlled by a number of factors, including the presence of transcription factors and the state of the DNA.

Task:
1. Read the information carefully.
2. Write a short definition of transcription.

RNA Processing:
The process of converting a primary transcript into a mature mRNA molecule. This involves the removal of introns and the joining of exons. The process is controlled by a number of factors, including the presence of small nuclear ribonucleoproteins (snRNPs) and the state of the DNA.

Task:
1. Read the information carefully.

Translation:
The process of converting the genetic code in an mRNA molecule into a protein. This involves the use of transfer RNA (tRNA) molecules and ribosomes. The process is controlled by a number of factors, including the presence of initiation factors and the state of the mRNA.

Control of Gene Expression

Specification Link: Genomes 6.3.3

Epigenetics:
Changes to the DNA that affect gene expression without changing the sequence of the DNA. These changes can be made to DNA that affect gene expression.

What effect does heterochromatin have on gene expression?

Heterochromatin:
A tightly packed form of DNA that is not transcribed. It is associated with DNA methylation and histone deacetylation.

Acetylation:
The addition of an acetyl group to a histone protein, which loosens the DNA and allows for transcription.

Phosphorylation:
The addition of a phosphate group to a protein, which can affect its function.

Explain the role of histone modification

Post-transcriptional regulation is the control of gene expression at the RNA level, therefore between the transcription and the translation of the gene. It contributes extensively to gene expression regulation across human tissues.

Mathews,2001 Since the 1996 publication of Translational Control there has been fresh interest in protein synthesis and recognition of the key role of translation control mechanisms in regulating gene expression This new monograph updates and expands the scope of the earlier book but it also takes a fresh look at the field In a new format the first eight chapters provide broad overviews while each of the additional twenty eight has a focus on a research topic of more specific interest The result is a thoroughly up to date account of initiation elongation and termination of translation control mechanisms in development in response to extracellular stimuli and the effects on the translation machinery of virus infection and disease This book is essential reading for students entering the field and an invaluable resource for investigators of gene expression and its control

Real-time PCR M Dorak,2007-01-24 With a variety of detection chemistries an increasing number of platforms multiple choices for analytical methods and the jargon emerging along with these developments real time PCR is facing the risk of becoming an intimidating method especially for beginners Real time PCR provides the basics explains how they are exploited to run a real time PCR assay how the assays are run and where these assays are informative in real life It addresses the most practical aspects of the techniques with the emphasis on how to do it in the laboratory Keeping with the spirit of the Advanced Methods Series most chapters provide an experimental protocol as an example of a specific assay

Perdew,Jack P. Vanden Heuvel,Jeffrey M. Peters,2008-08-17 The use of molecular biology and biochemistry to study the regulation of gene expression has become a major feature of research in the biological sciences Many excellent books and reviews exist that examine the experimental methodology employed in specific areas of molecular biology and regulation of gene expression However we have noticed a lack of books especially textbooks that provide an overview of the rationale and general experimental approaches used to examine chemically or disease mediated alterations in gene expression in mammalian systems For example it has been difficult to find appropriate texts that examine specific experimental goals such as proving that an increased level of mRNA for a given gene is attributable to an increase in transcription rates Regulation of Gene Expression Molecular Mechanisms is intended to serve as either a textbook for graduate students or as a basic reference for laboratory personnel Indeed we are using this book to teach a graduate level class at The Pennsylvania State University For more details about this class please visit <http://moltox.cas.psu.edu> and select Courses The goal for our work is to provide an overview of the various methods and approaches to characterize possible

mechanisms of gene regulation Further we have attempted to provide a framework for students to develop an understanding of how to determine the various mechanisms that lead to altered activity of a specific protein within a cell

Translational Regulation of Gene Expression 2 J. Ilan, 2012-12-06 This book which results from the dramatic increase in interest in the control mechanism employed in gene expression and the importance of the regulated proteins presents new information not covered in Translational Regulation of Gene Expression which was published in 1987 It is not a revision of the earlier book but rather an extension of that volume with special emphasis on mechanism As the reader will discover there is enormous diversity in the systems employing genes for translational regulation in order to regulate the appearance of the final product the protein Thus we find that important proteins such as protooncogenes growth factors stress proteins cytokines lymphokines iron storage and iron uptake proteins and a panorama of prokaryotic proteins as well as eukaryotic viral proteins are translationally regulated Since for some gene products the degree of control is greater by a few orders of magnitude than their transcription we can state that for these genes at least the expression is translationally controlled Translational regulation of gene expression in eukaryotes has emerged in the last few years as a major research field The present book describes mechanisms of translational regulation in bacteria yeast and eukaryotic viruses as well as in eukaryotic genes In this book we try to provide in depth coverage by including important examples from each group rather than systematically including all additional systems not described in the previous volume
