

## 1.2 Description

The primary function of a concrete structure is to support loads. When a concrete structure is damaged, its ability to support loads is compromised. The repair process aims to restore the structure's original strength and durability, ensuring it can safely carry the intended loads.

The repair process involves several steps, including assessment, preparation, placement, and curing. The assessment phase involves identifying the extent and location of the damage. Preparation involves removing the damaged concrete and exposing the sound concrete. Placement involves placing the repair material in the prepared area. Curing involves protecting the repair from drying out and ensuring it gains sufficient strength.

The repair process is a critical part of maintaining the safety and integrity of concrete structures. It requires careful planning, execution, and monitoring to ensure the repair is successful and the structure remains safe for use.

## 1.3 Materials

1. Concrete repair materials include cementitious materials, aggregates, and admixtures. The choice of materials depends on the type and extent of the damage, the required strength, and the environmental conditions.
