Empirical Assessment of UML Class Diagram Layouts Based on Architectural Importance Bonita Sharif, 2010 The dissertation presents a suite of empirical studies that investigate the effectiveness of different layout techniques for Unified Modeling Language UML class diagrams Three different layout schemes are examined The architectural importance of classes is used to guide each layout technique Architectural importance in a UML class diagram is defined by stereotype information in this case the control boundary and entity class stereotypes Stereotypes are an extension mechanism provided by the UML that allow users to define semantics for the notation The premise is that layout techniques for UML class diagrams significantly impact comprehension The experiments use traditional questionnaire based methods as well as eye tracking equipment to quantitatively measure the performance of subjects solving specific software maintenance tasks Both high level and low level software engineering tasks are examined The layout techniques are also applied to design pattern comprehension in class diagrams Two of the experiments are replicated using an alternate method of data collection to support and verify the findings In addition the effect of identifier styles camel case and underscore on the readability of UML class diagrams are also examined and is viewed as complementary to layout schemes used The main contribution is a detailed empirical validation of a set of layout techniques with respect to a variety of software maintenance tasks Results indicate that layout plays a significant role in the comprehension of UML class diagrams In particular there is a significant improvement in accuracy time and visual effort for one particular layout scheme namely multi cluster In addition a set of quantifiable eye tracking measures are presented that provide an objective metric to measure the visual effort for class diagram layouts The ultimate purpose of the research is to determine effective ways to adjust the layout of existing UML class diagrams to support program comprehension Based on the empirical evidence a set of guidelines for layout adjustment is presented

A Formal Semantics of UML Class Diagrams Based on Transformation

Systems Jennifer Tenzer, 2001 Abstract UML class diagrams are a widely used technique for modelling the static structure of object oriented software systems In this report a formal semantics for UML class diagrams is presented A given UML class diagram is not directly interpreted in a formal way but translated into a specification diagram first During the translation process an algebraic specification extended by an action signature for operations is created for each class Afterwards the relations of the class diagram are considered which leads to an update of the class specifications The resulting specification diagram can then be interpreted by transformation systems which are formal mathematical models of dynamic systems System snapshots represent complete system data states and operation calls the transformations in between Within a system snapshot an object configuration is given for each class containing families of algebras modelling the states of the objects currently existing Furthermore reference functions for resolving object references connect the object configurations in

system snapshots The different parts of a system snapshot must be related in such a way that certain context conditions are satisfied Since no information about dynamic system behaviour is given by a class diagram the dynamic part of transformation systems as interpretations of specification diagrams is left open Therefore the semantics of a class diagram is defined as the set of all possible interpretations for its corresponding specification diagram

Translation of UML Class Diagrams Into Diagrams of Transformation Specifications Jennifer Tenzer,2000 Abstract UML class diagrams are a wide spread technique for modeling the static structure of a system Although part of the UML standard definition their semantics is not completely formalized and often ambiguous The approach of this paper is to formalize UML class diagrams by translating them into diagrams of transformation specifications For this purpose a translation algorithm is given in this paper It translates UML classes into transformation specifications which are special algebraic specifications enlarged by an action signature for dynamic aspects The translation of relations in a class diagram induces changes of the transformation specifications for the classes These changes have to be accomplished according to an order which reflects important properties of class diagrams that can be expressed more precisely with this technique than in the UML standard definition

Rendering UML Class Diagrams to Support Layout Design Paul Joseph Leyden,2019 This thesis investigates and implements mechanisms to render and layout software design models that are reverse engineered from software systems The software design models are represented as Unified Modeling Language UML class diagrams UML diagrams are widely used by software developers to document the design of software systems The work presented here extends a software system srcUML that takes source code as input and generates a graphical picture of the UML class diagram The system is built on top of the srcML infrastructure This infrastructure parses the source code and provides access to the abstract syntax for the analysis necessary to generate the UML class diagram The main contribution of the work presented is extending the system to support various layout algorithms for the class diagrams The extension allows users to provide their own customized layout algorithms to the system This directly supports research in software comprehension by allowing comparison between different layout algorithms No current UML rendering tools allow different custom layout algorithms to be used The system is open source and available at www.srcML.org
