Topic: Health & Medicine | Words: 1128 | Pages: 5

Clinical Practice Guidelines (CPGs) are useful documents that can support can improve the quality of nursing care available to patients. CPGs guide caregivers to provide emergency and evidence-based nursing support. One of the clinical problems affecting many healthcare settings is suicide risk. Suicide remains “a major health challenge especially in emergency care settings” (Emergency Nurses Association, 2012, p. 2). The selected CPG document for this exercise offers guidelines for effective suicide risk assessment. The title of the document is “Clinical Practice Guideline: Suicide Risk Assessment”.

Scope and Purpose

Suicide remains a leading cause of premature deaths or injuries in the United States. In emergency care settings, suicide remains a major challenge towards delivering evidence-based medical support. This fact explains why the Joint Commission National Patient Safety Goal (NPSG) requires “medical institutions to identify and assess the environmental aspects that can increase the risk for suicide” (Fowler, 2012, p. 82). Individuals who have increased chances of committing suicide will pose a major threat to the healthcare delivery process.

This problem explains why the above Clinical Practice Guideline (GPG) was developed. The document evaluates “the existing literature for the evaluation and assessment of clients who have suicidal ideation” (Emergency Nurses Association, 2012, p. 3). The document can be used
