

## Applications of the Logarithmic Function

The magnitude of an earthquake measured on the Richter scale is given by:

$$R(I) = \log\left(\frac{I}{I_0}\right), \text{ where } I = \text{amplitude}$$

Find the Richter scale rating of an earthquake with amplitude  $1.87 \times 10^6 I_0$ .

$$\begin{aligned} R(I) &= \log\left(\frac{I}{I_0}\right) \\ &= \log\left(\frac{1.87 \times 10^6 \times I_0}{I_0}\right) \\ &= \log(1.87 \times 10^6) \end{aligned}$$

$$R(I) = 6.27$$

Stein, 2014-04-09 Defending society against natural hazards is a high stakes game of chance against nature involving tough decisions How should a developing nation allocate its budget between building schools for towns without ones or making existing schools earthquake resistant Does it make more sense to build levees to protect against floods or to prevent development in the areas at risk Would more lives be saved by making hospitals earthquake resistant or using the funds for patient care What should scientists tell the public when as occurred in L Aquila Italy and Mammoth Lakes California there is a real but small risk of an upcoming earthquake or volcanic eruption Recent hurricanes earthquakes and tsunamis show that society often handles such choices poorly Sometimes nature surprises us when an earthquake hurricane or flood is bigger or

has greater effects than expected from detailed hazard assessments In other cases nature outsmarts us doing great damage despite expensive mitigation measures or causing us to divert limited resources to mitigate hazards that are overestimated Much of the problem comes from the fact that formulating effective natural hazard policy involves combining science economics and risk analysis to analyze a problem and explore the costs and benefits of different options in situations where the future is very uncertain Because mitigation policies are typically chosen without such analysis the results are often disappointing This book uses general principles and case studies to explore how we can do better by taking an integrated view of natural hazards issues rather than treating the relevant geoscience engineering economics and policy formulation separately Thought provoking questions at the end of each chapter invite readers to confront the complex issues involved Readership Instructors researchers practitioners and students interested in geoscience engineering economics or policy issues relevant to natural hazards Suitable for upper level undergraduate or graduate courses Additional resources can be found at <http://www.wiley.com/go/SteinPlayingagainstnature>
