features One on the top in memory OLTP tables for superior performance With abundant computer memory why keep tables on slow disk Developers across the world face database issues daily While immersed in procedural languages with loops RDBMS forces them to think in terms of sets without loops It takes transition It takes training It takes experience Developers are exposed also to Excel worksheets or spreadsheets as they were called in the not so distant past So if you know worksheets how hard can databases be After all worksheets look pretty much like database tables don't they The big difference is the connections among well designed tables A database is a set of connected tables which represent entities in the real world A database can be 100 connected tables or 3000 The connection is very simple row A in table Alpha has affiliated data with row B in table Beta However even with 200 tables and 300 connections FOREIGN KEY references it takes a good amount of time to become familiar to the point of having an acceptable working knowledge The Cemetery of Computer Languages is expanding You can see tombstones like PL 1 Forth Ada Pascal LISP RPG APL SNOBOL JOVIAL Algol the list goes on For some the future is in question PowerBuilder ColdFusion FORTRAN and COBOL On the other hand SQL is running strong after 3 decades of glorious existence What is the difference The basic difference is that SQL can handle large datasets in a consistent manner based on mathematical foundations You can throw together a computer language easily assignment statements looping if then conditional 300 library functions and voila Here is the new language Mars 1 named after the red planet to be fashionable with NASA's new Mars robot However can Mars 1 JOIN a table of 1 million rows with a table of 10 million rows in a second The success of SQL language is so compelling that other technologies are tagged onto it like XML XQuery which deals with semi structured information objects In SQL you are thinking at a high level In C or Java you are dealing with details lots of them That is the major difference Why is so much of the book dedicated to database design Why not plunge into SQL coding and eventually the developer will get a hang of the design Because high level thinking requires thinking at the database design level A farmer has six mules H how do we model it in the database We design the Farmer and FarmAnimal tables and then connect them with FarmerID FOREIGN KEY in FarmAnimal referencing the FarmerID PRIMARY KEY in the Farmer table What is the big deal about it It looks so simple In fact how about just calling the tables Table1 and Table2 to be more generic Ouch Meaningful naming is the very basis of good database design Relational database design is truly simple for simple well understood models The challenge starts in modeling complex objects such as financial derivative instruments airplane passenger scheduling or a social network website When you need to add 5 new tables to a 1000 table database and hook them in define FOREIGN KEY references correctly it is a huge challenge To begin with some of the five new tables may already be redundant but you don't know that until you understand what the 1000 tables are really storing Frequently learning the application area is the biggest challenge for a developer when starting a new job The SQL language is simple to program and read even when touching 10 tables Complexities abound though The very first one does the SQL statement touch the right data set 999 records and 1000 or 998
